The period of gestation is one hundred and fifty-four days. With plenty of good shed-room and good feed, lambs may be dropped in April; otherwise May is the best month. See that lambs are properly suckled. The ewe's teats are often closed with a gluey substance, which should be forced out and the milk started. After once starting, the lamb will take care of the rest. It is sometimes found necessary to feed lambs by hand. Have a can made for the purpose shaped like a tea-pot, holding about a quart, and with a raised ring at the end of the spout to hold a nipple. The milk should be fresh and about as warm as it comes from the ewe. Feed a little at a time about every three hours the first two or three days. After that three times a day will do. Keep the lamb warm and dry, and when the weather is warm let it run out. With good care, sheep will always be healthy. Be careful in changing from green to dry food, or from dry to green. It should be done gradually. A mixture of three ounces sulphur to one pound salt, kept in a dry place where the sheep can always get at it, is an excellent preventive of costiveness, colic and similar troubles among the members of the flock.

Sheep are always benefited by a change of pasture. If only one pasture is available, it would be

Fig. 2.—SIDE OF FEED RACK.

best to divide it with a hurdle fence, and change from one division to the other, every two weeks. Figures 1 and 2 show the best feed rack for sheep and calves that we have seen. Figure 1 gives the end view, and figure 2 the side view. The rack is fourteen feet long; the posts *a*, are four by four inches, center-piece, *x*, is a two-inch plank; cross-braces and side-pieces *c*, are two by four inches. The bottom is of inch boards. Hay-rack pickets are three inches wide. The ends are boarded up as

seen in figure 1. Six-inch boards, *s*, are nailed along the sides, making the feed-boxes five inches deep. The bottom is twelve inches above the ground. This rack is very strong, roomy and unexcelled for feeding hay, grain or cut feed. Figures 3 and 4 show the mode of constructing good, cheap hurdle fences. Figure 3 is a finished length; the lower piece is a twelve or fourteen-foot board, six inches wide. The middle bar is a strip two inches wide

Fig. 3.—A SHEEP HURDLE FENCE.

and one inch thick, on the top is a wire with very short barbs. The uprights are four-inch boards, sawed as shown at *a*. At *b* is a brace. The slot in the top receives the ends of the lengths of fence, and is ten inches above ground. They are sawed out of six-inch boards as shown at *c*, with very little waste. Figure 4 represents another fence. The lower bar is two by three inches; uprights, same as in figure 3, are let into it. It is supported on short legs one inch thick.

Sheep should be carefully trimmed and tagged when sent to pasture. If their winter quarters are clean, they will not need much tagging. Lambs may be weaned when four to five months old. Keep them out of sight of their mothers and feed them well. The ewes will dry quicker if upon short feed a few days. A dose of buck-shot, administered with a gun, is the best physic for sheep-

Fig. 4.—ANOTHER HURDLE.

killing dogs. When a sheep dies from natural causes, as is frequently the case, do not charge it to the "dog account," as is too often the practice.

A New Use for Peat Moss.

The Peat Moss, or Sphagnum, which abounds in bogs, whortleberry swamps, and morasses in the Northern States, is now utilized as an excellent article for bedding in stables, as well as for packing plants in commercial nurseries. In the olden time, almost the only use made of sphagnum was to eak the cider press, when the months for making cider came around. Straw was much plentier then than now, and there was not much demand for it in cities and villages. No one dreamed that the day would ever come when the worthless moss, which creeps unobserved over cold swamps and bogs, as they fill up with vegetable decay from their borders, would ever have any commercial value. That period has come, and the peat moss crop is henceforth to be added to the valuable resources of many a farm, and gives value to land, where ferns, brushes, and aquatic plants grow. The peat moss gathered, dried in the sun as thoroughly as we dry hay for the barn, may be baled like hay or straw for the general market, or stored for bedding for home use. It is claimed for the commercial article, that it is cheaper than and superior to straw, or any other bedding, on account of its spongy, elastic, absorbing, and disinfecting qualities. It absorbs nine times its own weight of moisture, retains the ammonia from the urine of the animals bedded with it, and is therefore exceedingly valuable as a manure. These claims may be a little exaggerated. We have used for years sun dried, salt marsh sods, cut in six or eight inch cubes for bedding, and thought them hard to beat.

But these are only available for shore farmers. The peat moss is much more widely distributed, and is within reach of a multitude of farmers, either upon their own or their neighbor's premises.

We are far too penurious in the use of bedding or absorbents in the stable. It pays to stable horses, working oxen, and milch cows at night, the year round. The ordinary method of keeping cows in the open yard at night, or in the pasture, is wasteful, as one will discover by visiting the barn of a thrifty farmer who stables his cows and oxen, and uses dried peat or other absorbents, to be dropped into the barn cellar beneath when saturated. The accumulation of this sheltered fertilizer is very large in the course of the pasturing season, and its value is seen in the rank growth of the crops where it is applied. We welcome any good article of bedding, especially one so widely distributed and so easily procured as peat moss. In the districts where it grows, the experiment of using it cannot be very costly, and it may lead to valuable results. Even if it should fail at first to prove a commercial crop, it could hardly fail to have a large home market. It would certainly save straw, which has a ready sale at remunerative prices in the vicinity of large towns and cities, and within easy reach of sea-ports and river landings. The moss that grows upon the surface of the peat and the bog meadow, is more easily gathered than the peat and muck that lie underneath. It makes a cleaner and softer bed, keeps the cattle drier, and probably retains the ammonia as well or better. Experiment with peat moss. CONNECTICUT.

How Frogs Help Farmers.

Mr. C. M. Weed, of the Michigan Agricultural College, has recently examined the contents of the stomachs of eight common frogs (*Rana hulecina*), and finds undoubted evidence of the usefulness of frogs as destroyers of insects injurious to farm and garden crops. The average quantities of various insects and other substances determined by the examinations are as follows: Insects, eighty per cent.; Spiders, five per cent.; Sow-bugs, one per cent., and the balance, vegetable matter of various kinds. Of the insects, over half are known to be injurious, and one-quarter are on the doubtful list. Much of the vegetable matter, (leaves, etc.) was probably swallowed accidentally, along with the insects and spiders. Nearly all the stomachs contained grasshoppers, and in one they made up seventy-six per cent of the contents. The Carabid beetles formed a large part of the food taken by some of the frogs. The Strawberry Crown Girdler was well represented, as also were several other pests of the garden. Much has been said for and against the frogs, the robin, and the crow, but there is no evidence of usefulness more positive than the finding of large numbers of injurious insects in the stomachs of these creatures. Under the dissecting knife, the frog is sure to have its right to live vindicated. By their good works we shall know them, and learn to protect our croaking friends, as well as their relatives, the toads.

Apples Stored in Pits.

Apples may be stored in pits like potatoes, and if kept dry and frost-proof, will come out in fine condition in the spring. It is a fact, however, that apples thus stored, decay more rapidly when removed from the pits, than similar fruit stored in a dry house cellar with an even temperature, only a few degrees above the freezing point. When apples are kept in pits for the spring market, they should be shipped as soon as possible after being removed, and not to a very distant city. Pitted apples will need frequent assorting when exposed for sale. The apple crop this year is heavy, and only the best fruit should be stored in any manner. Let it be remembered that fruit keeps best in a dry, cool, and dark room. Pits are inexpensive, and if well made, not large, the fruit separated from the earth by straw, and when opened, quickly marketed, there need be no great loss of fruit.

Beautifying the Farm.

There are many owners of farms, especially those of moderate size, who would gladly gratify their tastes in beautifying the estates, did they know that this could be done at a small expense, and at the same time not diminish the usefulness of the farms. In this country one rarely sees the *ferme ornée* (the ornamental farm) so common in France, which shows that a large share of garden beauty need not conflict with the strictest farm economy. There are in this country many farms of so much natural beauty, that it only needs to make the best use of the materials already on the ground, and to abolish the rectangular rail fences, those prolific nurseries of weeds, to convert them into scenes of rural beauty. Aside from the gratification such a change would afford the farmer and his neighbors, its greatly increased value, should the place be sold, would warrant a much larger outlay than need be made in effecting the improvement. To show what may be done in this direction, we give Mr. Elias A. Long's plan for the improvement of a small farm, concerning which, he writes us:

As shown there are six fields, besides orchards, groves, kitchen garden, and grass plats, adorned with trees, shrubs, flowers, etc. The house, nearest to the street, and the barn a little further back to the left, are reached by drive-ways which lead gracefully to the main buildings, and throughout the farm. The grass plats in front of the house and barn, or any other building, may be kept closely clipped with the lawn mower, or else—especially the larger ones—they may be mown three or four times during the season for feeding to live stock. In such a plan the fields may be surrounded by hedges, or sometimes advantageously by wire fences. By running a wire fence

AN ORNAMENTAL FARM.

Drawn and Engraved for the American Agriculturist.

around the plat immediately back of the barn, and using it as a permanent pasture, it will present from the street and house the appearance of an extension of the ornamental grounds, because the grass being kept closely pastured, will look as well

as if shorn with the lawn mower, while the fence may be so inconspicuous as hardly to be seen a short distance off. By running a lane from the pasture down through the center of the next section beyond, to the farm circle, located in the most distant point of the drive, live stock can easily be driven to any lot of the farm if desired. In the plan, a walk leads from the house to the right, past a flower bed in the lawn, to the kitchen garden, thence near the drive, with shrubs and hardy flowers in places at the side, to the grove on the right. Here may be an arbor to afford shelter, both from sun and rain. Another arbor occupies a grass plat in the center of the rear circle. Between the drive and fence of this circle, there are five spaces of grass that may have beds cut in them to be filled with shrubs and plants. A farm of any size, or a fruit and vegetable garden, laid out on some such plan, may prove on this account in itself a great source of pleasure to the residents of the place, as well as to persons who may be visitors.

Prevent Chicken Cholera.

We find that our flock of thirty Plymouth Rock fowls, confined in a small yard, eat eagerly, and thrive upon, any chopped green food offered them. When the early lettuce was gone, we by way of experiment gave them chopped sunflower leaves, which were greedily devoured. We are convinced that cholera among fowls—as among men—may often be prevented by cleanliness, especially in drinking water. Few fowls confined in chicken yards, or even running at large, have access to perfectly pure water, or as much as they wish. The water left for them in vessels is soon soiled by their feet and excrement, and becomes a reasonable source of disease. We have kept large sardine boxes, which are about deep enough for fowls' convenience, and a wooden trough in our little chicken yard. These are emptied, rinsed, and refilled with fresh water twice a day—oftener if very warm. We have not lost a chicken by cholera, though our neighbors just across the street, and throughout the town, have lost a great many with that disease. Our care with the drinking water has been rewarded by plump, clean, young broilers.

Dryness in the Fruit House.

After a low and even temperature is secured, the other essentials in preserving fruit are: darkness; an air-tight room, to retain the carbonic acid given off by the fruit, and a dry atmosphere. As stated elsewhere (p. 423), fruit in ripening gives off both carbonic acid and water, or moisture. The carbonic acid, by excluding the oxygen of the air, aids in preserving the fruit. Moisture is undesirable, as it hastens decay. The only effective method of removing it is by exposing in the room some substance that will absorb it. The French use Chloride of Calcium, which is a very different substance from Chloride of Lime. This salt has such an avidity for moisture, that it takes it from the air of the room and becomes liquified. The objection to this is its expense. An American experimenter has found a substitute in the "bittern," or waste material of the salt works, which is thrown away. This is mainly a very impure chloride of calcium, and answers the purpose. The bittern, in a large iron pan, is exposed in the fruit room. When it has become liquified by the moisture absorbed, the pan is set over a fire and the salt dried, by driving off the water it has absorbed, when it is again ready for use. This process may be repeated indefinitely.

The Streaked Cottonwood-Beetle.

The Cottonwood trees (*Populus monilifera*), through the west and south, have been badly infested with leaf-eating grubs during the present season, and in answer to inquiries concerning the pest, we present the accompanying engravings. The fat brown grubs emit a pungent fluid, from

Fig. 1.—BRANCH OF COTTONWOOD.—Engraved for the American Agriculturist.

tuberculous spines situated back of the dark colored head. These voracious larvæ soon eat out the soft part of the Cottonwood leaves, leaving only a network of fibres. The pupa, or inactive, state following the grub condition is passed upon the leaves. The mature beetle is black and yellow, variously mixed with three interrupted lines of black or bluish spots upon the wing-covers. The beetles and grubs may be destroyed by spraying the infested trees with a mixture of Paris Green or London Purple and water. Figure 1 represents a branch of Cottonwood, with eggs at *a*, enlarged at *b*; newly hatched grubs at *c*, and enlarged ones at

Fig. 2.

d, d, d. A pupa is at *e*. Figure 2 shows the beetle at *a*, with a hair line at its right indicating the natural length. At *b, c, d*, and *e*, are half-beetles, showing the variations in the color of this insect.

"Book Farmers."

All intelligent, successful farmers are book farmers—just as all good lawyers and doctors are book lawyers and book doctors. It is monstrous nonsense to deride a farmer because he reads agricultural books and agricultural papers. He may be a great reader and a very poor farmer. He may be a lazy man, that prefers to sit down rather than to hold the plow, or to read rather than to think. But that is not the fault of the books, or the papers. He might do something worse.

We hazard nothing in saying that the world never had better agricultural papers than to-day—and never were papers more needed. The farmer who can read and does not take an agricultural paper, makes a great mistake. No matter how much experience he may have had, or how much he knows, he will be glad to see what others are doing, and to hear what they have to say. He is not obliged to adopt their methods. Many silly things get into some of the papers. They raise a smile, but do no harm. The wise farmer will sift out the wheat from the chaff. He will find suggestions that are valuable. Nothing is easier than to forget. We know many things that escape our memory, and a good paper recalls them to our mind.

We might make higher claims, but leave that to the intelligence and candor of the farmers. A good agricultural paper is worth ten times what it costs, and every intelligent farmer knows this. J. H.

Walks and Talks on the Farm.

New Series.—No. 4.

JOSEPH HARRIS, M. S.

"I am undecided whether to pack my apples in the small or large barrels. I have quite a lot of the small barrels on hand."—"If you do not want to use them," said the Deacon, "I will take them—so that need not stand in the way."—The fact is, the Deacon is getting tired of this discussion.

"I have just returned from Buffalo, Deacon," I said, "and feel proud of the American farmers. Farmer life is supposed to be quiet and slow. But I could not help being struck with the intense activity, energy and enterprise everywhere manifested. The railroads, with their immense traffic, show what the farmers have done, and are now doing. There are four trunk railroad lines converging towards Buffalo, and all look to the farmers of the West for support, and in the meantime distributing a good deal of money all along the various routes. We are disposed to grumble at railroad managers, and very justly, but they have done, and are doing, great things for us. India is going to build railroads, and will undoubtedly yet be a great wheat growing country; but we have the railroads ready built and equipped, and able and anxious to carry all the wheat we can produce. We have got the start in the race, and shall hold our own.

"Never mind all that," said the Deacon, "tell us what you saw."—"What I saw," said I, "is of little consequence. It is the impression left on the mind, the new resolutions one makes, and the hopes engendered that are of consequence. A man who stays at home on his farm as much as I do, is apt to get discouraged. He needs to see what others are doing. I came home and started the plows. That is the effect it had on me. I saw one man plowing a clover sod with three horses. It had been cut for hay, and he was turning under a nice growth of clover, intending, no doubt, to sow wheat. This was the only sod land I saw being plowed. Occasionally I saw a summer fallow, but, as a rule, three-fourths of all the wheat is evidently grown after barley or oats. Barley is preferred, because it is harvested earlier than oats, and we have a better chance to get the soil into good condition before sowing the wheat. Three-horse plows were the rule. I saw but one two-horse plow at work, and I felt sorry for the horses and the man. The three-horse teams went joyfully along, doing good work with ease. It was a pleasure to look at them. Many were drawing out manure, and plowing it under for wheat. They will doubtless use phosphates also. I saw many large flocks of sheep, principally Merinos and their grades. If they do not bring in much money for wool, they cost comparatively little to keep them. They are the scavengers of the farm. One flock was in a summer fallow, another in a rough, bushy and weedy pasture. Cows, of which many are kept to supply Rochester and Buffalo with milk, receive better treatment. Near the villages we see some Jerseys and their grades, also patches of corn-fodder. Here is a team scraping out a ditch on low land. I have done this kind of work myself, but gave it up. Repeated plowings on the side, turning the furrows from the ditch, followed with a bright, long-handled shovel, and a stout Irishman who knows how to use it, does the work cheaper, and what is more important, you are likely to go deeper and get better drainage. On the next farm is a piece of basket willows, and then we strike higher, rolling land, with large wheat-fields, thrifty orchards, good roads, three-horse plows, steam thrashing machines, comfortable houses, and a mowing machine cutting weeds on some low land, lying between the upper portions of the farm. I mentally took my hat off to the man. At the next station I saw a farmer made happy by receiving some finger guards and sections for his reaper. The telegraph and railroads are wonderful institutions, and farmers are beginning to learn how to use them. A young farmer cannot too soon form the habit of sending for things

rather than going himself. There are men who would have thought it necessary to go to the shop themselves, to have got these repairs."

"That is so," said the Deacon, "but how are you going to teach them?"—"Nothing is easier," said I, "let a boy sit down and write a letter to a seedsman for a catalogue, and then order a few seeds. If he sees a book advertised that he wants, let him send for it. If he gets bit once or twice, as he will be very apt to, he will learn to discriminate."

The next thing we want is the steam plow. It will surely come—and when it does come, we shall wonder how we ever got along without it. It is not ten years since a steam thrashing machine was a rare thing, and the Deacon and others shook their wise heads, and talked about fires, insurance, and explosions. Now we have steam thrashers by the score, and I do not know of an old-fashioned horse-power machine in use. The Deacon is thrashing with a steamer to-day, and a traction engine at that, with all the modern improvements, and is as happy as a clam. He would laugh at the idea of hitching his well-eared for teams to a thrashing machine. The rapid introduction of the steam thrashers is proof to my mind, that when it is once proved that plowing can be done by steam, there will be plenty of people to take hold of the business. The farmers will not own the steam plow any more than they own the steam thrashers. They will gladly have the work done by the acre—just as many of us now have our wheat, and barley, and oats cut and bound by a reaper and binder, and our grain thrashed by the bushel. One of my neighbors has two or three binders, and two or three steam thrashers, and his boys go around cutting and thrashing grain, making quite a business of it. A few days ago he was building a stone wall, and wanted to haul some large stones for the bottom tier. We usually hitch three horses to a stone-boat, and occasionally four. My neighbor hitched his traction engine to the boat, and it walked off with all the stones the boys could pile on. Steam plows have been used extensively in England for many years. Their use here has been hindered by the high rate of interest on money, and the comparatively high price of coal. In a section where corn is used for fuel, there is no chance for the steam engine. Where hay and oats are dear and coal cheap, there we want the steam plow. If we keep all the horses we need to do the work promptly and thoroughly, there are times when there will be little for them to do. But the horses must be fed all the time. The iron horse eats only when he is at work. If he does not cost too much, and the food he eats is as cheap as it ought to be, he is just the horse that the American farmer needs. Our seasons are short, and we have a good deal of hard plowing to be done just at a time when there is plenty of other work for the horses. On my own farm, for instance, I have fifty acres of land that I would like to sow to wheat this fall. During the dry, hot weather in August, our strongest and best wheat land, especially if we have just harvested a crop of barley or oats, is hard to plow. The poor horses come home at noon and night covered with sweat and dust, and tormented with flies. If I had a good steam plow, I could find plenty of other work for the horses to do, and if I could not, they would enjoy a few days vacation in a good pasture. The steam plow, or cultivator, would break up this hard, dry, strong wheat land, and the scorching sun would kill the weeds, and we could soon get it into prime order for winter wheat. We shall soon have plenty of young men able to manage the engines. Mark my word, steam plows will be as common as steam thrashers, as soon as railroad directors and coal companies have had a little common sense hammered into them.

The Fair of the Royal Agricultural Society of England was held this year at Shrewsbury, in Shropshire. I wanted to be there, but could not arrange it. The Fair was held there in 1845, and I attended it. How well I recollect several features of the Show, but especially the plowing match, when a boy with a gray team, without lines, won

the prize—or ought to have won it, I forget which! My impression is that he did the best work in the field, but was a minute or two behind time, and so lost the prize. I did not know the boy, but have thought of him a great many times since. His furrows were as straight as an arrow, and turned over with mechanical accuracy. I wonder if farmers' boys take as much interest in such things now as I did then. If so, we ought to have more plowing matches and more trials of implements. I have been to a great many fairs since then, have exhibited occasionally, and it has seemed to me as I have watched the people pass, looking tired and listless, that they took little interest in the exhibition. But why should I think so? I presume, at the Royal Fair in 1845, I passed from pen to pen, and stand to stand, looking at the stock and the implements as silently and listlessly as any farmer's boy of to-day, and yet I know that the impressions then made have remained with me ever since. And I have no doubt that the fairs of to-day do just as much good as at any previous time. In 1845, the fair ground embraced twelve acres, this year seventy acres. As I look back, it seems to me there was a grand display of implements and machines. The records show there were nine hundred and forty-two implements exhibited in 1845, and five thousand two hundred and forty-two in 1884, and so the boys of to-day have more to see than their fathers."—"Yes," said the Deacon, "and more to learn."

"Well, Deacon," said I, "how many bushels of wheat did you get?"—"Two hundred and ninety-seven from ten acres. I sowed twenty bushels, and it shelled out on the ground as much as I sowed. Clawson wheat if not cut just at the right time, shells badly. But I did not expect over two hundred and twenty-five bushels, and so I have no reason to complain."—"I should say not," said the Doctor, "especially as it was after oats. In a good season, it is quite clear that our land will produce as much wheat as when the country was new."—"This would seem to be the case," said I, "provided the land is drained, well tilled, and you drill in one hundred and fifty or two hundred pounds of superphosphate per acre. How long this will last remains to be seen. I think that sooner or later we shall have to keep more stock and make more manure."

"Yes," said the Doctor, "and raise something besides wheat. The whole world seems to have rushed into wheat growing. It would seem that wheat and wool can be grown on cheap land and sent thousands of miles to market. The yield per acre is small, and the profits moderate, but it is a good thing to have cheap wool and cheap bread."

"I am not so sure about that," said the Deacon, "when the farmer suffers, everybody suffers with him."—"I do not see much suffering," said the Doctor, "notwithstanding the low price of wheat, farmers are unusually healthy, hopeful, and happy. The sober, industrious, and economical farmer has nothing to fear except bad seasons, and this season has been very favorable. Last year was the worst season in many years, and many farmers suffered more than is generally known."—"True," said I, "there is no lack of anxiety on a farm at all times, but the year 1883 was one that sorely tried our courage and faith. We had nothing to sell. We have now good crops, and even with the low price of wheat, we are not forgetful of the past, grateful for the present, and hopeful for the future."

"We have plenty of straw and hay," said the Deacon, "and it will be a good time to fatten sheep this winter."—"I think it will," said I, "but John Johnston used to say that the year he made the most money in fattening sheep was when oats and corn were high. Farmers would not feed grain to sheep when it brought a good price in market, and the result was that few sheep were fattened in winter, and the few who had fat sheep the next spring got a big price for them. But since then, the times have changed, the low freight charges make corn, and mill-feed, and cotton-seed cake, nearly as cheap here as at the West. This is one point to be considered. Another is, that the price of good mutton is less variable than formerly.

Mr. Johnston and others who fattened sheep in winter, made their money by buying the sheep cheap in the fall, and selling them at considerable advance per pound in the spring. I imagine there are few years when this could not have been done. Charley," said I, "take down any two consecutive volumes of the *American Agriculturist*, and let us see what has been. For, as a rule, what has been, will be. Never mind what year, pick it out at random."—"Well," said he, "here is Volume XVIII, 1859."—"Very well," said I, "now look at the New York Market Report in the October number, and give us the price of sheep." Charley read as follows: "The markets have been glutted, and farmers wishing to buy stock for winter feeding have been more fortunate than those having to sell. In such an overstocked market it is impossible to sell by weight. Prices ranged from one dol-

of cotton-seed or linseed meal per head per day. You would have a large pile of rich manure in the yards in the spring, and you could then beat me raising cabbages, cauliflowers, celery, turnips, beets, onions, carrots, salsify, cucumbers, melons, and squashes."—"I can beat you anyway," said the Deacon, "though I do need more manure."

The Deacon rents some of his low, mucky land to some Germans, who raise cabbages, Swede turnips, etc., on shares. He made a good thing out of it last year. The cabbages and turnips are drawn to our local railroad station, and sold to a dealer.

The Stage Coach in New York City.

When the railroad car took the place of the slow stage-coach, it deprived travel of most of its pleas-

skill in "handling the ribbons." A parade of the Coaching Club is something well worth seeing, and the club makes occasional excursions to more or less distant points. On one occasion its members, or a part of them, drove to Philadelphia and back, by the stage-route followed before the days of railroads. One member of the club is so enthusiastic a coachman, that he runs a daily coach between one of the hotels of this City and a point in the suburbs. He takes passengers at a round price, and thus allows those who are not members of the club, to enjoy the pleasures of this mode of travelling. So popular is the Tally-ho Coach, that places are engaged many days ahead. The passenger by the coach leaves the City by that beautiful gateway, Central Park, and sees the City melt gradually into the country. His road takes him past beautiful villas, as well as primitive farm houses. His

PELHAM BAY.—END OF THE STAGE ROUTE.

Engraved for the *American Agriculturist*.

lar to two dollars per head for poor stock; two dollars and a half to four dollars for good sheep. A few large fat ones bring five dollars to seven dollars each. These prices are about equivalent to three and a half to four and a half cents per pound live weight."—"Now," said I, "get Volume XIX, 1860, and look at the Market Report in the March number."—Charley read as follows: "Sheep and lambs are now in short supply, and are worth five and a half to six cents per pound, live weight, for fair to good sheep, and six and a half to seven and a half cents for very fat premium mutton."

"It is clear," said the Doctor, "that the farmer who bought sheep in September or October that year, and sold them the next spring, made money."—"Yes," said I, "if he bought the right kind of sheep and took good care of them, and fed well, he made money and manure at the same time—which is what we want to do."—"I suppose," said the Deacon, "you mean by the right kind of sheep, some of the English breeds of mutton sheep."—"No," said I, "not necessarily. Let me tell you, Deacon, you cannot do a better thing than to fatten enough sheep this winter to eat up all your straw, bean-fodder, corn-stalks, and clover hay that you do not need for your horses and cows, and give the sheep at the same time at least a pound

ures. One sees but little of the country as he is whirled rapidly through it amid noise and dust. There is no way in which scenery can be so well enjoyed, as from an outside seat of a stage-coach. The moderate rate of speed allows all the beauties of the scene to be appreciated, and the changes of the road present an ever-varying panorama. Then the stage-coach allowed of social enjoyment, and chat and stories made the time pass pleasantly. What a contrast between the tavern, where the stage-passengers stopped for dinner, and the present railway station with its "five minutes for refreshments!" There is so much that is pleasant and enjoyable in travel by stage, that wealthy gentlemen in New York City and vicinity not long ago formed a Coaching Club, each member of which has a "coach and four." There are now many members of the club. Each has a coach made in the best possible style. The body of each, and the running gear is painted in a different style from the others. The horses are carefully selected, and have the most complete harness and trappings. The coaches have seats for six upon the roof, besides a place for the "guard," who with his horn announces the arrival of the coach. The driver is usually the owner of the coach, and there is no little friendly rivalry among the members over their

senses are soon saluted by the refreshing sea air, and he arrives at his destination, prepared to do justice to the bountiful dinner that awaits him. His destination is Pelham Bay, one of the most charming spots upon Long Island Sound, an engraving of which we have made from a drawing furnished us by the Park Commissioners. He here exchanges the varying scenes and sights of the road for one of tranquil beauty. The blue waters of the Sound stretch out in front of him, and the many sailing craft go lazily by, their quiet being in strange contrast to the fussy little steamer that occasionally passes. After a few hours of rest at Pelham Bay, the homeward journey is commenced, and the passenger enjoys the same scenes in the light of the declining sun, and reaches the starting point just as gas-lights and electric lamps are replacing the daylight, refreshed by the novel mode of travel, and the change of air and scene. "But," some may say, "it is very expensive."—So it is, but unlike many of the amusements of the wealthy, every dollar expended by the Coaching Club helps some one. The coach maker, the painter, the harness maker, and many other trades are benefited, and even the farmer, who breeds stage horses, has their value increased by what some regard as the extravagance of the Coaching Club.

Characteristic Heads of Sheep.

A sheep's head, after life is extinct, is pure offal. It is almost good for nothing. Even the horns are nearly valueless—usually absolutely so. A half-starved dog will hardly look at a sheep's head, and chickens will pick off only a few shreds of flesh. The tongue is, however, sometimes pickled, and the brain made use of by some deft cooks. The only thought that we know of that has ever been given to sheep's heads, has been to reduce their size, eliminate horns, and encourage the growth of a few locks of wool upon spots where it is obviously an inconvenience to the animal, unless, indeed, it may serve as a cushion in butting. It is therefore not surprising that we find the heads of different breeds to vary so characteristically, simply because they have been let alone, and Nature has had her own way with them. This fact is shown most strikingly in the spirited sketches of heads which we herewith present. Nothing can be more woolly than the Merinos, or more meaty than the Long-wool heads, when named in connection with what we know of the respective breeds. As might be supposed, however, the Merino rams are pugnacious. Well-armed they certainly are, and they make good use of their heads. The horns are useful in this respect, they not only give great additional weight to the blow of the head, but defend it and the ears from the glancing blows, and enable it the better to stand the "shock of battle." The weaponless Long-wools are much more pacific in their nature, and though they can deal heavy blows with their bare polls, they are not often pugnacious in their dispositions. They incline to take life easily. The sweets of indolence are their joy, and in their resting time they lay on the flesh and fat for which we value these animals so highly.

Management of Sheep in Winter.

JOSEPH HARRIS.

To winter sheep successfully and economically, it is desirable to have them in good, thrifty condition before winter sets in. In a state of nature, the luxuriant herbage in the autumn enables animals to grow strong during the mild weather, and to store upon the kidneys and intestines, and other parts of the body a quantity of surplus tallow that can be used to eke out the scanty supply of food during the cold and stormy weather of winter. It is a wonderful provision of Nature. Not infrequently during severe snow-storms, sheep are as dependent on this stored up fat, as bees on their stored up honey.

If man interferes with this arrangement of Nature, he must work in accordance with Nature's laws. If he expects his sheep to thrive on straw during winter, he should see to it that they have good pasture in the summer and autumn. If he confines them to overstocked pastures, he should remember that they cannot store up surplus fat, and that if he would carry them comfortably through the winter, he must provide a liberal supply of food before winter sets in.

Shepherds, like poets, are born, not made. You may find a dozen men who can be trusted to take care of horses, cows, or pigs, to one who is fit to be entrusted with the management of sheep. Why, we do not know. All the great sheep-herders of the world have given much of their own time and labor to the care and supervision of their flocks. We have not space here to go into details, and in fact it is not necessary, as these vary greatly, according to circumstances. Much must be left to

the common sense and experience of the shepherd. If any of our readers are going to keep sheep this winter, and have had little experience, we would advise them to consult some good farmer in the neighborhood, and in addition to this, the following hints may be useful: Sheep must have dry quarters. Nothing is so injurious as damp, ill-ventilated cellars, barns, or sheds. Do not think you can make such places warm and dry and comfortable by the liberal use of straw for bedding. This only makes the matter worse. There is nothing

HEADS OF WOOL-FACED SHEEP—RAM AND EWE.

a sheep dislikes more than a fermenting manure pile. To compel a flock of breeding ewes to lie on a mass of damp straw and manure several inches deep, is almost certain to be followed by a weak, puny, sickly crop of lambs. We once knew a valuable flock of South-downs that has entirely disappeared. Goitre destroyed the lambs. We knew another large flock of Long-wool sheep that suffered severely in the same way. In the former case the sheep were shut up in a small shed and yard. The rain from the roof of the shed ran into the yard. Straw was thrown in from time to time, and the poor sheep were compelled either to stay in the shed or stand on this mass of wet straw. In the other case the sheep had damp sheds and cellars to sleep in, but as they had the run of a large yard, the results were not so disastrous. Many lambs died of goitre and infantile pneumonia, but as soon as dry quarters were provided, the animals gradually improved in health.

If you have a dry barn, shed, or basement for the sheep to run in, you have the first essential to success. If your barn, or shed, or basement is large

Bedding the sheep is an important matter that should have daily attention. The less straw you can use, and the sheep yet have a clean bed to lie on, the better. When sheep are fed straw, the true plan is to attend to the bedding every time you feed. Put plenty of straw in the racks, and let the sheep pick out the best of it. Then before the next feeding, go over the entire surface of the sleeping apartment, and stir up the straw that is trodden down, shaking the manure to the bottom. Any straw that is pulled out of the racks and trodden under foot, should be removed

and scattered about where needed. Then take out all the straw from the racks, and spread it lightly and evenly over the sleeping apartment. If the racks are out of doors, it will be necessary in wet weather to vary this plan. Fresh straw will occasionally have to be used for bedding the sleeping apartment, and the damp straw from the racks can be spread about the open yard. Our rule is to salt the sheep once a week. It would be better possibly to have lumps of rock salt placed under cover, where the sheep could lick them at their pleasure. Give water regularly twice or three times a day. Let it be fresh and free from snow and ice. We have all observed how eagerly sheep will drink running water as it flows in the

trough fresh from the pump. The temperature of such water as it comes from the well is about fifty-five degrees. After it has stood a little while in a frozen tub, with more or less ice and snow, it is reduced nearly to thirty-two degrees. The heat lost, especially in stormy weather, is worth saving. It is during storms that the skill of the shepherd manifests itself, and he will be glad that he has provided dry quarters for his flock. If his buildings are not all provided with cave troughs, and proper arrangements made to carry off the surplus water, he will resolve that another winter will not find him in such a sad and helpless condition.

A Convenient Derrick.

From a communication sent us by a Western Farmer, we condense the following, with changes and additions. A convenient "derrick" for raising slaughtered animals, for suspending heavy hogs in scalding, dressing beeves, and for sundry other purposes, can be cheaply and quickly made thus:

Take three scantlings two by six inches, and fourteen feet long, or any other desired length and strength. Round poles will answer, by hewing flat on two sides, a small portion of the upper ends. Bore corresponding holes in the top of each, and insert a strong iron bolt, with large head on one end, and large nut and screw on the other. Let the bolt fit loosely to allow a little play. These pieces can fold together for storage, and be raised to any desired height short of perpendicular. Bore a series of small holes along the upper sides of two poles, for movable iron pins, or larger ones for wooden pins. These may be fastened in, or better two loose pins for moving to

HEADS OF BARE-FACED SHEEP.

enough not only for the sheep to sleep in, but also to feed in, so that they never need go into the rain, so much the better. Breeders of fine-wool sheep would say that this is absolutely necessary. Breeders of English sheep admit the advantage but not the necessity. We know very healthy flocks that are fed all winter out of doors, simply having a barn floor and shed to run in at their pleasure. In dry weather the sheep prefer to sleep out of doors, especially if the ground is frozen, and they have a little clean straw to lie on. They do not like mud or wet, dirty straw.

higher or lower holes. By placing the feet of these two poles against firmly driven stakes, and drawing the third and rear pole inward, the center will be elevated with considerable force, the power required decreasing as the timbers approach a perpendicular, when a beef carcass, for instance, is nearly lifted from the ground, and hangs more heavily. If desired or necessary, horse-power can be applied by using a rope with a clevis or otherwise, attaching it to a double-tree or to a whiffle-tree. A single horse will be sufficient for raising a large carcass by means of this tripod derrick.

A Florida Barn.

In a semi-tropical climate, the out-buildings are made as open as possible for free ventilation. The

Fig. 2.—EXTERIOR OF A FLORIDA BARN.

barn shown in the engravings, is suited to the farmers of Florida and other Southern States. The ends of the barn are boarded up close, to prevent rain from beating in, but the sides and the partition

Fig. 2.—GROUND PLAN.

between the shed and main floor are made of three-inch slats, with one inch space between, admitting plenty of air and light. A door leads from the shed into the stable; the latter is divided into two stalls, or left in one. At the South, an earth floor for stable is usually preferred to plank. Figure 1 shows the exterior of the building, and figure 2 gives the ground plan.

Proper Testing of Butter Cows.

Great stress is laid upon the amount of butter a cow will make in a trial of seven days or a month. The milking, weighing of the milk, the salting and working of the butter are under supervision, as if the quantity and quality of the butter, decided the profitability of the cow, and the price she ought to bring in the market. We have many registered cows that produce fourteen pounds of butter in a week, and a few go up into the twenties. A very few are stated to have produced twenty-five pounds in a week. It is thought to be within the range of probability that a cow will yet make nine hundred pounds of butter in a year. These large figures have set the old heads upon the farm to serious thinking, which is a very good thing, and started some doubts, which is better. They begin to question, whether fourteen pounds of butter in a week on selected rations, in addition to grass, pays any better than seven or eight pounds on grass alone. They want a cow that will make the most butter upon a given value of food. It is the exception rather than the rule in the record of these large yields of butter, that we have any fair statement of the rations or the result of these large yields upon the condition of the cow. They wish to know what a pound of the tested butter yield costs. There is a demand for a trial of these cows upon grass alone. That would not fully decide the comparative merits of cows. One animal might weigh a thousand pounds, and another but five hundred, and of course it would take a much larger portion of the rations to keep up the condition of the former than of the latter. One cow might have an accumulation of fat, while the other was in poor condition. There might be as much difference in the condition of the pastures as in the flesh of the cows, or if the grass was equally lush, pasture might be worth twenty-five cents a week in a rural district, and a dollar a week near a city. The cry for a trial "on grass alone," will not give us the light we want. We desire to know just what it costs Mr. Bonanza to get a hundred pounds of butter out of his four thousand dollar cow, "Magnificat." There is the interest on the investment during the butter trial—the cost of pasturage in his vicinity, the quantity of the additional rations, and their value, and finally the cost of manufacture and marketing the butter. "Magnificat" is a splendid looking animal, and Mr. Bo-

nanza may find pleasure and profit, from an æsthetic point of view, in owning her. It pays to buy pictures. But if it costs fifty one cents to get a pound of butter, which will sell for only fifty cents, the old heads are not able to see where the profit comes in. If there is a profit it can be shown by the record, and it ought to be. No better card can be made for Mr. Bonanza's registered herd, than to show that he can get more butter out of a hundred dollars' worth of rations, than it is possible to get out of any other breed or their grades on the same value of fodder. But what of the profit from the sale of calves and registered stock? It is very good now, but what will it be, if they are not proved by satisfactory tests to be the best machines for extracting butter from fodder?

Raising Onion Seed.

For two years onion seed has been very cheap. If we may judge from past experience it will sooner or later be high again. It is a good time for those who have had the experience in raising seed, and wish to engage in the business, to set out a few bushels of onions. Let them select the very best onions, and especially avoid all those with thick necks. It does not pay to grow your onion seed unless you grow the very best. You can buy plenty of poor seed—and lose money by it.

Onions for seed can be set out in the autumn or in the spring. If proper precautions are taken, autumn is the better time. The land must be moderately rich, and thoroughly worked. Onion roots run down deep into the subsoil, and it is therefore essential that the sub soil should be free from stagnant water. Low, mucky land that will produce good crops of onions, will not always produce onion seed. Dry upland is better and more certain—or rather it is less uncertain, for at best, onion seed growing is rather an uncertain business. You may get a good crop of seed and a good price, and the crop may bring you in one thousand dollars per acre—or it may all "blast." We mark out the rows three and a half feet apart. Make a furrow three or four inches deep. Set out the onions in the rows so thick that they will almost touch each other, and cover carefully and well two or three inches deep. If heavy rains wash the soil away from the onions, they must be covered again before winter sets in. If they cannot be well covered with earth, draw out some manure or straw, and spread it two or three inches thick over the rows, or over the whole surface of the land. There is no danger of the onions being injured by the frost, provided they are well covered, but if this precaution is not taken, and we have little snow for a cover, many of the onions will be killed.

The same remarks apply to onion sets. These can be safely set in the autumn, but they must be carefully covered with earth, or with earth and manure or straw. When proper care is used, we would much prefer setting them out in the autumn.

A Movable Pasture Pen.

We had a field this year, on which many rank weeds grew, and desiring to prevent them from going to seed, we made a movable pen, and pastured the ground with pigs. Four panels, like the one shown in the illustration, were set in a square, and secured by wires at each upper corner. This provides a strong, secure pen, which can be moved

A PANEL FOR PASTURE PEN.

about easily as often as the pigs root up all the weeds in the enclosure. By means of this contrivance, we kept the weeds in check until the field

was plowed. Aside from eating the weeds, the pigs destroyed many injurious insects found in the soil. A calf can be kept in such an enclosure in a corner of a meadow or other field, where it could not be let loose. By making the panel sections of pickets, a goose-pen is provided. If the sections are used in a row, let the braces on every alternate one stand in an opposite direction from those next to them. In this way they firmly brace the fence.

A Combined Hinge and Sliding Gate.

J. R. L. Dean, Greene County, Ohio, sends us sketches of a gate especially suited for barn-yards. It is fourteen feet wide for ordinary use, and has three short posts. The middle one is movable. A box of two-inch boards made to fit the post is planted in the ground; in this the post is set, and can be removed at pleasure. This post is placed three feet from the outside one. The hinge is made of hard-wood, with a wheel six inches in

Fig. 1.—THE GATE OPEN.

diameter, as shown in figure 1. It should be so constructed that the gate will move freely, but not too loosely. It is supported at the top by a cap placed diagonally across, and at the bottom by a block of locust or cedar under it. The middle uprights of the gate should be placed a little to one side of the center, so that the gate can be balanced upon the roller. Wooden catches are placed in the middle post, upon which the gate rests. To open the gate, push it back to the middle post, elevate the gate slightly, and it will roll down to the center, where it can be readily opened. Figure 1 shows the gate open, and in figure 2 it is seen

Fig. 2.—THE GATE CLOSED.

closed. This gate has no latch. A barn-yard gate is not usually opened wide. A space large enough to admit a man or horse is all that is necessary in most cases. It is more easily opened than the ordinary gate, and will stay where it is placed. By cutting a notch in the third board, and elevating it to the upper catch on the middle post, a passage is made for hogs and sheep, excluding larger animals.

Northwest Winds Kill the Peaches.

Mr. Josiah Hoopes, author of "Book of Evergreens," and an experienced horticulturist, has observed for several years that excessive northwest winds invariably affect peach trees disastrously, while those of a lower temperature coming from any other quarter, are not serious. Extreme dryness, along with the high northwest winds, accompanied by very cold weather, most affect the health of the peach tree. If the air can be filled with moisture, there is much less danger from the winds and cold. With these observed facts in mind, the peach grower should take all possible precautions. An evergreen or other wind-break upon the northwest side of a peach orchard, may make all the difference between an abundant crop and no fruit.

Holland Cattle.—A Good Record.

A few years since the milk records of Crown Princess (Echo's dam), which was a little over fourteen thousand pounds in a year, and of Topsy forty pounds eight ounces in a day before she was two years old, attracted a great deal of attention among dairymen. About this time, Lady Clifden produced over sixteen thousand pounds of milk, and Maid of Twisk more than fifteen thousand pounds in a year. Among the highest daily records were those of Texelaar, Crown Princess, Fraulein (Echo's grand-dam), Lady Clifden, and Maid of Twisk, all of which ranged in the seventies. The greatest butter record published, as made by this breed, was seventeen pounds by Texelaar, in six days. Subsequently many dairymen and others became gradually impressed with the belief, that this breed of cattle (called Holstein, and imported from Holland), was superior to all others for the combined qualities of producing milk, cheese, and beef. The result of this has been an increase in importation of from five to ten head in a year, to more than twice as many hundred. During the past four months about eighteen hundred head of cattle, imported from Holland, have been offered for registry in the Holstein Herd Book.

The number of Holland cattle imported during the year beginning April 1st, 1884, will doubtless be over three thousand head. Many cattlemen and authorities assert, that a general-purpose-breed is an impossibility; that one cannot have a Shorthorn and a Jersey in one breed, or a Clydesdale and English Thoroughbred in the same animal. That is not the question. Is there a breed of cattle which pays the farmer in the dairy, and also in producing beef? If so, which breed is best adapted for this purpose? The Holland has certainly proved itself not only one of the best general-purpose-breeds we have, but a very remunerative investment for milk, cheese, butter, and last, but not least, for beef. The advance made by this breed during the past ten years exceeds the anticipations of its ardent admirers. The young stock make a rapid growth. A gain of three to four pounds and upwards in live weight per day is frequently made, and one instance of five and a third pounds per day for thirty days is recorded. This is believed to be the greatest increase for the length of time ever made by a neat animal. Yearlings often weigh a thousand pounds and upwards, two-year-olds from a thousand to thirteen hundred, mature cows sixteen to twenty hundred, and bulls in proportion. About three years ago, Aaggie made a milk record in one year of eighteen thousand and four pounds, since which time this record has been exceeded five times, viz: by the astonishing record of Violet of over eighteen thousand six hundred pounds, an Ohio cow over eighteen thousand seven hundred pounds, the imported cow Empress over nineteen thousand seven hundred pounds, and twice, two years in succession, by Echo, eighteen thousand one hundred and twenty pounds, and twenty-three thousand seven hundred and fifty pounds. Echo has given an average of over fifty pounds a day for more than two consecutive years. Two-year-olds have increased their daily records from forty pounds eight ounces to over sixty pounds, and in one instance Aaggie Constance is credited with sixty-seven pounds, and mature cows are recorded as giving eighty to one hundred pounds and upwards in a day. Empress is said to have given in Holland forty-eight litres a day for twelve days in succession, which is a trifle over one hundred and nine pounds daily. The cows Jamaica and Etelka have records this year of one hundred and twelve pounds and one hundred and one pounds of milk per day respectively. These are the highest records yet made in America. As butter producers these cattle have also taken the lead of all others. Mercedes' record of ninety-nine pounds six and one-half ounces of unsalted butter in thirty days, which has not been equalled, gave her the championship of the world. Jantje made ninety-one pounds of butter in thirty days. Nietje Korudyke's record for thirty days is ninety-five pounds.

Princess of Wayne made ninety-one pounds eight ounces in thirty days. The owners of this animal have seven cows, all five years old and younger, except one, that have averaged over twenty pounds per week, four that have made over twenty-one pounds, and two over twenty-two pounds eight ounces per week since January 1st, 1884. Are there any herds among the butter breeds which excel this remarkable record? DUDLEY MILLER.

Adobes as a Building Material.

J. L. TOWNSEND, UTAH.

The early settlers of the Far West, although fresh from the woodland regions of the Mississippi Valley, and the New England States, were not slow in abandoning the log cabin, and adopting instead the sun-baked adobe houses of their Mexican neighbors. The old Mexican adobes are large and clumsy, being twenty-four inches long, twelve inches wide, and six inches thick, and so heavy that both hands of the mason are employed to lift and place them, thus requiring the trowel to be laid down in handling each piece. This was too unworkmanlike for the brick-layers, who demanded a more convenient size, and adopted a dimension which is still in use. A brick-shaped piece of moulded earth or clay, baked in the hot sun, two and one half inches thick, five inches

Fig. 1.—A MEXICAN ADOBE.

wide, and ten and one half inches long, is now the common adobe of this country. There are blue adobes, white saleratus adobes, and common adobes (pronounced "doby"). Both the white and blue adobes are made from beds of clay found in the lowlands. These clay beds are more or less impregnated with an alkaline salt. The common adobes are made from any loamy or clayey soil with sufficient adhesive properties to permit the pieces being handled when dried or baked. Formerly adobes were made at the clay beds, thus forming the adobe yards to be found everywhere near the towns and villages. These "doby yards" bear some resemblance to the country brick-yards of the Middle States, but lack the debris of the kilns, the kiln-stacks, the piles of fuel, and the sheds of the yards that were made in rainy climates. In some of these adobe yards the common pud-mill of the old-fashioned brick-yard is occasionally seen. The adobes made from clay mixed by these mills, are not considered nearly as strong as those made in the more primitive way of treading and mixing the material with the feet.

Adobes are made at the yards as follows: Selecting a place on the bed of clay convenient to water, or where water can be obtained by a small ditch reaching to the nearest irrigating ditch, the top

Fig. 2.—A CONVENIENT ADOBE.

soil is shoveled away where the clay is to be excavated. A space is cleared of the salt grass and

rabbit-brush, and leveled for a drying floor. The "doby" maker, with a boy to assist, digs out one or more yards of clay, forms a mound so shaped as to soak up water, throws or runs water upon it and leaves it to soak over night. In the morning this clay is mixed by treading into rather a stiffer mass than can be worked through a mill.

The "doby" maker then commences to mould by forcibly throwing double-handfuls of the mud into the moulds, leveling them off with a sweep of the hands, and pushing the mould to the boy who empties it on the drying-floor.

Another mould is filled while the carrier is emptying the first, and so on. An average day's work is five hundred adobes, but from eight hundred to a thousand are frequently made by rapid and skill-

Fig. 3.—AN ADOBE HOUSE.

ful workers. After being partially sun-baked, they are turned up on edge, and when sufficiently dry are placed in convenient piles. It takes these adobes in dry summer weather, about one week to dry.

The loading, transportation, and unloading of these adobes made at the yards, damages a large number by knocking off the corners and edges, and it is now customary to have them made where the building is to be erected. The clay is piled at a convenient place, and water procured by digging out a small temporary ditch.

Common adobes are always made on the site where they are to be used, frequently from the earth excavated from the cellar. These are made either by foot or machine, according to the quan-

Fig. 4.—ADOBE WALL, THIRTY-NINE YEARS OLD.

tity required. They are used either for the inner side of walls or for division walls, where they are not exposed to the weather. In the order of durability, when exposed to the weather, the "white saleratus doby" is all that could be desired.

In examining carefully the wall of a house erected twenty-nine years ago, this variety shows no appreciable wear, while the blue adobes intermixed in the same wall are more or less weather-beaten and worn. This wall has a southern exposure, and has stood the beating rains from the south and west since first erected. In the same dwelling the walls facing east and north show no marks of weather wear, appearing smooth and in as good order as if but recently constructed.

The Daikon—Japanese Winter Radish.

Travellers in Japan mention the very general use in that country of a large white radish, called "Daikon," the varieties of which are given distinctive names. Some of these sorts have been cultivated in France, and are there regarded as a valuable addition to the list of winter vegetables. Those of our readers who have tried the "California Large White Winter Radish," recently offered by our seedsmen, have made the acquaintance of one of the forms of the Japanese Daikon, which has been sent out with the above new name. The usual form of the Daikon is that of the "Cow-horn Turnip," but much larger, measuring from one to two feet in length, and four to six inches in diameter. The exterior is usually a very pure white, but those tinged with rose-color and violet have been produced. The usual form is that shown in figure

Fig. 1.

Fig. 2.

Fig. 3.

1, and called by the Japanese *Maru nerima*; those given in figure 2, *Shicneain*, and in figure 3, *Kedis-sue*, are the principal variations from figure 1. In France the seed is sown during the first half of August. If sown earlier, the roots throw up seed-stalks, and if much later, the roots do not have sufficient time to properly develop before frost. The soil should be fine and rich, and, if possible, manured the previous season. On poor soil, artificial fertilizers are used. The crop, especially on light land, requires an abundance of moisture, as it makes the roots more tender. The roots are used as soon as large enough; those to be stored for winter use are pulled, the tops removed, and stored in a cave or cellar, covering them with earth or sand. If no cellar is at hand, the roots may be kept in pits in the field, like turnips, covered with sufficient earth and straw to prevent freezing.

In quality the Daikons are compared to a very mild turnip. The roots are used raw like our radishes, or to form a part of salads. They are most generally cooked, and in France have been found acceptable in soups, and when stewed and served with various sauces. Properly stored, so that they will not shrivel, the roots keep until spring.

A Hand-Cart.

A hand-cart can be advantageously employed in drawing vegetables from the garden, lawn, grass to the barn, and in various other ways. It may be fitted for sprinkling in dry weather, by attaching a barrel or a water-tight tank to the platform. If the pig pasture is a considerable distance away, the same cart may be used for conveying swill. A hand-cart will frequently save harnessing the team, and may be used in many places where horses cannot go. A pair of wheels from an old buck-board, a light wagon, or a sulky horse-rake, with any common axle, will answer for the running-gear. Two pieces of hard-wood, eight feet long and two inches square, make the sides of the platform. The axle should be mortised for the reception of the side-pieces, and three-quarter inch bolts used to hold the parts together. Cross-

pieces of hard-wood are placed between the side strips, upon which rest the bottom boards, running lengthwise. The side-pieces should extend at least six inches beyond the bottom board, thus giving space for grasping the cross-bar at the end, when drawing or pushing the cart. These handles should be round and smooth. Legs, or standards, may be hung to the middle of the cross-pieces so that the cart will stand level and firm.

The Tule Lands and their Cultivation.

M. E. BAMFORD.

For the past thirteen years efforts have been made in California to reclaim that part of the country lying along the Sacramento and San Joaquin rivers, commonly known to the dwellers in this State as the "Tules." The tall rushes with which these lands are covered, furnish the Indians with material to make their tule canoes, in which they could go a considerable distance to sea. The roots of the tule also afforded food for the Indians. Tule rushes are now used for making baskets and carpet-lining. The latter is in use in most of the court-rooms of San Francisco, and in many private houses. However, the rushes themselves are not of sufficient importance to prevent their being turned under by the tule-plows in such portions as can be protected by levees from the river. Tule lands, when reclaimed, are among the most productive portions of the State. A great part of the vegetables sold in the San Francisco market, come from Chinese farms on these reclaimed tules. The Chinese market gardeners pay a yearly rent of from twelve to twenty dollars per acre. The tules are especially valued in dry seasons, as when it has become evident that crops on the uplands are to be failures by the drouth, seed may be afterwards planted on the tules, and a good return realized.

In some counties, as San Joaquin, these swamp lands comprise about a quarter of the entire county. Yolo County, on the Sacramento, obtains its name from the tule rushes, the Indian name for which was "yo-doy." There are yet left in Yolo County several hundred thousand acres that are overflowed by the Sacramento every year, notwithstanding the very expensive attempts made to reclaim them.

Some of the men who have spent most in the hope of reclaiming these lands, have lost one crop in three. About twenty thousand of these acres have recently been bought by an English syndicate, worth several million dollars, and it is expected that about half a million dollars will be necessary for reclaiming the portion bought. An immense levee is now being built around this section.

In many places along the Sacramento the levees are very large, being sometimes over twenty feet high, and from one hundred and fifty to two hundred feet thick, forming a carriage-drive on top. The debris sent down by hydraulic mining has been a constant annoyance to farmers in the tule districts. The bed of the river being filled up of course causes the water to rise, and the levees must be raised in proportion. This causes additional expense to the farmers, who, in many places, as Sutter County, which has for its entire length on Feather River a line of levees, have to raise funds for maintaining these bulwarks. In some districts the tax on the farms for this purpose is very great, often averaging as high as six dollars and fifty cents per acre. The recent decision in regard to the discontinuance of hydraulic mining, will probably have a tendency to diminish this taxation in future. The levee fund raised by taxation is expended under the direction of a Board of Commissioners chosen by the land owners. Men are constantly employed in watching the levees for any signs of breaking, in keeping down the vegetation upon them, and in poisoning the gophers that would dig dangerous holes if left to themselves.

Many of the tule islands of the Sacramento and San Joaquin, such as Union, Roberts', Staten, Boulder, and Rough and Ready Islands, have been reclaimed by means of levees, and yield good crops. The total amount expended for levees by Yuba County alone, amounts to three hundred thousand dollars. Some tule lands have been known to

yield eighty-three bushels of barley to the acre. After levees have been built, some farmers try to clear their land by firing the tules. This process is attended with danger, however, as the fire sometimes spreads to the uplands and destroys the fences and crops of the farmer and his neighbors. In places, tule fires will run for hundreds of feet at a depth of one or two feet under ground, and then burst out again at some unexpected place, so that it is impossible to estimate the probable damage of such a fire. Nothing but rains will stop it when once under way. The tule reeds are much more safely got rid of by use of the tule-plow made for the purpose. The State has sold, up to the present time, in the valley of the Sacramento, about five hundred and forty-nine thousand acres of tule lands.

An Entirely New Plum.

A number of shrubs and small trees which came from a European correspondent a few years ago, were planted in a nursery row preparatory to making a final disposition of them. This year one of these attracted attention by a show of fruit. It proved to be *Prunus Simoni*, Simon's Plum, a native of the northern part of China. The tree, now about ten feet high, has slender, erect branches. The lance-shaped leaves are minutely serrate on the margin, and with two to four small globose glands at the base. The leaves are dark-green and shining on the upper surface, and lighter colored and dull below. The fruit, ripe about August 10th, sometimes reaches two inches in diameter, though usually smaller, and has a very short stem. It is much flattened lengthwise, and at a short distance appears like a diminutive apple. It has a distinct, but not very deep suture. The skin, which is perfectly smooth, is of the dark-red color known as *cinabar*. The flesh is of an apricot-yellow color, and somewhat adherent to the stone. The stone has a nearly orbicular outline, thicker on one side than on the other, and marked with furrows and holes in a similar manner to the peach, though in a less degree. The fruit has an agreeable and peculiar odor, recalling that of the apricot. The flesh, while not very juicy, is, when fully ripe, agreeable, with a marked and pleasant flavor, in which the

THE SIMON'S PLUM.

taste of bitter almond is quite perceptible. It is the possibilities that this new plum presents, rather than what it now is, that interests us. When we see what has been done in improving the Sand Pear by hybridizing, we hope some one may experiment with the Simon's plum, and make it the foundation of a new class of plums, and perhaps of peaches. Pomologists will observe in this fruit a remarkable union of the characters that distinguish the plum and the peach. Its smooth skin, and the character of the flesh are those of a plum, while the glands at the base of the leaves, and the grooved and rough stone are like the peach. Indeed, Decaisne originally named it *Persica Simoni*, Simon's Peach. This species shows that Benthams and Hooker were right in uniting the almond, peach, plum, cherry, apricot, etc., all under the single genus *Prunus*.

Small Yorkshire Pigs.

Small Yorkshire swine are an English breed, and the result of the best efforts to improve white pigs. It comes of many crosses, and is no doubt built upon some family of pigs in the county of York. English breeds of pigs have been so much inter-

it is safe to say that animals of their blood will be among the winners this year at every prominent agricultural show from Maine to California. We are happy to give accurate measurements of these famous pigs. Those of King John were taken when he was thirty months old, and Snow-drop was measured when five years old, and prob-

Early Spring Pigs.

For many reasons it is desirable to have pigs come early in the spring. There is no single valid objection to it, and many advantages. The first day of March is the first day of spring, but pigs born that day may find our climate no milder, or more favorable than if they came into the world during a blizzard in mid-winter. At any rate, the foster hand of man, and provident care, will be necessary in either case. And this will be equally true if we postpone the event until the first of April. In June, July and August, we often let the sows have pigs in the fields, and we are not sure but these are good months in which to let the pigs start on their short career. The objection to it, if it be an objection, is that the pigs have to be wintered over. We do not propose to discuss this question here. All we wish to say is, that if you want spring pigs to fatten and sell the following autumn, you must not only get a good breed or cross, but you must feed well from the beginning to the end, and try to get an early start. The period of gestation in a sow is one hundred and twelve days, or sixteen weeks. Sows served November 1st, should come in February 21st. In our experience it is just as easy to have pigs in January as in March or April. Of course you cannot control this matter. The only thing to do, if you wish early pigs, is to bring the sows up from the summer pasture the latter part of October, and give them more stimulating food. If they have had nothing but grass for several weeks or months, a liberal grain diet in addition to grass, or other succulent food, will be likely to accomplish the object. The farmer who raises many pigs, makes a mistake if he does not keep a quiet, well-bred boar on the farm. If he has had experience only with a rough, ill-bred hog, that would tear down the pen or eat it up, we do not wonder he objects to keeping one. But there is no necessity for keeping such animals. Get a pure-bred boar of some quiet, refined breed, and there is no more difficulty in keeping him, than there is in keeping a ram or a rooster. One of the most profitable branches of pig raising is the supplying of young pork to the markets or private customers. Many families will gladly pay an extra price for a cleanly fed and well fattened young porker that weighs two hundred pounds or less. To produce such pork of suitable size by autumn or early win-

SMALL YORKSHIRE BOAR "KING JOHN."—Drawn (by Forbes) and Engraved for the American Agriculturist.

bred, that the Agricultural Societies of England usually offer prizes for "small white" and "large white" pigs, and for black pigs of large and small size also—not attempting to distinguish between breeds. In this country we have drawn very close distinctions between Suffolk, Short-faced Lancashires, Small Yorkshires, and several other supposed or true breeds. It is very easy to establish a family of pigs, which will have the same general characteristics. Anybody can do it with one good thoroughly well-bred boar as a foundation, provided that after a few generations he can return in his breeding, and take another cross from a very similarly bred male animal of equal merit. This does not make a true breed, for with careless breeding it will revert as fast as it was formed, while a well established breed, even if neglected and carelessly bred, will remain true to its type a long time, though, of course, it too will gradually change if it does not entirely succumb. The Small Yorkshires are the result of so gradual an improvement and building up of good qualities, that they are recognized as an established breed, both in this country and in England by all classes of breeders. They are characterized by long bodies, which are both broad and deep, exceedingly little offat, small heads, wonderfully short faces, which are often not more than three or four inches long, measuring from the corner of the eye to the end of the snout, and not more than two, measuring from the deep wrinkle separating the forehead from the nose. The face has, however, great breadth. The legs are short, the belly in breeding sows usually touching the ground, hams, shoulders, and sides greatly developed. The skin is thin and well covered with hair, which is always white. Dark flecks in the skin, but not affecting the hair, are highly objectionable, but sometimes occur. Any black hairs indicate impurity of blood and are a disqualification. So strongly inbred is this color characteristic, that we have never known a pure Small Yorkshire male to get anything but white pigs, even when bred with Berkshire or Essex sows, the color of which is black. The two beautiful pigs of which we exhibit portraits, taken from photographs, are of the old and famous stock of Col. R. M. Hoe, now no longer a breeder. They were imported several years ago, and their blood is very widely disseminated among the herds of Small Yorkshires in this country, so much so, that

ably all things considered, was the best sows of the Small Yorkshire breed that has ever been imported.

persons unfamiliar with the Yorkshires may easily take the same from their own full-grown pigs as a comparison. These two animals are well known among Yorkshire breeders, and there are many pigs that have equaled the measurements given. There are thousands of witnesses to confirm the figures.

ter, it is necessary to have the pigs come very early. The milder climate of the Southern States is more favorable for the production of young porkers, but it is not difficult for them to be grown at the North with considerable profit by those who thoroughly understand the business. J. H.

Breeding Pigeons—Jacobins and Fantails.

More than ordinary attention is now being given to the breeding of pigeons, and scarcely a day passes without bringing to our attention the wonderful feats of the Homing variety in their remarkable trials of speed. We have given illustrations of the Carrier Pigeon, and now present engravings of

THE FANTAIL PIGEON.
Engraved for the American Agriculturist.

two other striking classes, viz., the Jacobins and Fantails. The various breeds of fancy pigeons present a wonderful variety in the color and markings, as well as in the size and form. So great are the differences among them that one finds it difficult to believe that all are varieties of one species of wild pigeon, yet no fact in natural history is better established than that all the domestic pigeons were derived from the Wild or Rock Pigeon of Europe. It is estimated that there are more than one hundred and fifty distinct kinds of pigeons which breed true and have been named. The peculiarities which distinguish the breeds are

THE JACOBIN PIGEON.—*Engraved for the American Agriculturist.*

not external markings alone. The skull, beak, and even important bones of the body have been altered in such a manner that the differences between breeds of pigeons are as great as between some genera of birds. The breeds of fancy pigeons should have special interest for the farmer and stock-breeder, as they show in a striking manner

how far it is possible to modify the typical form of a domesticated animal by human agency.

The Jacobin and the Fantail are very unlike in external appearance. The Jacobin is a very neat bird with long wings and tail, and a rather short beak. The distinctive feature of this breed is the hood, which almost incloses the head, and meets in front of the neck. The hood consists of certain feathers of the neck which are greatly increased in size and reversed in their growth. The hood gives a singularly quaint appearance to these exceedingly quiet, home-loving birds. The Fantails are quite the opposite of the modest Jacobins, being the proudest and most vain of all pigeons, and on account of their beauty are one of the most popular of all the fancy breeds. The tail in the wild pigeon contains twelve feathers. In the Fantail the number is greatly increased, as many as forty-two having been noticed. The feathers are long and broad, and are arranged in an irregular double row pointing upward and expanding like a fan. Though the usual position of the tail is erect, it may be depressed so as to sweep the ground. The bird has a full and broad breast, and its thin neck is bowed backwards. In the best birds of this breed, the carriage is a peculiar strut, the head being carried backwards until it touches the tail feathers. Fantails with pure white plumage are the most popular.

Wooden Foundations for Buildings.

In many sections where stone are scarce and brick not easily obtained, wood is from necessity employed in foundations for houses and other buildings. The wooden supports usually consist of sections of a log one or two feet in length, set upon end at the corners and other parts of the building. Blocks thus placed decay in a few years, especially where the sills rest upon them. There are two good plans whereby this trouble is in a great measure overcome. Two well seasoned and oiled blocks, four inches wide, two inches thick and ten inches long, are placed edgewise on the top of the foundation blocks. This insures a free circulation of air, and rapid evaporation after a rain. The lower block is cut in the form of a triangle, and laid upon the ground, thus shedding rain, and quickly drying out when wet. Another form of wooden support for small buildings

Animal Ailments.

PROFESSOR D. D. SLADE, HARVARD UNIVERSITY.

THROWING UP THE HEAD.—W. L. Liptrott, Brooklyn, N. Y., has a horse of much value, which has a trick of throwing the head up and down, and of moving the bit. He has tried different bits and martingales, but without effect.—Horses, like men, often acquire strange and unaccountable tricks, which are very difficult to overcome. The one in question is undoubtedly owing to long and continuous confinement of the head to some unnatural position in his early days, probably by the use of a tight bearing rein, with a more or less cruel bit. We know of no way of overcoming this difficulty, except by exercising the utmost patience, and by allowing all the freedom possible to the head and neck, consistent with the owner's comfort and safety. A plain bit, without the use of bearing rein should be tried. In the course of time, the trick may be overcome, or forgotten.

WEAKNESS OF THE LOINS.—W. Spear, Montgomery Co., Alabama, has a horse that rises with difficulty after lying down, and is troubled in getting up a hill even with a light load.—This condition is evidently dependent upon a weakness, which may be the result of injury to the spinal cord, such as would be caused by a sprain or a blow. Whatever the cause, the animal is in no condition for work, and should be at once turned out to grass to recuperate his strength, before being again subjected to labor. Where practicable, douches of cold water upon the loins and spinal cord may be of service during the summer months.

STRUCK BY LIGHTNING.—R. Berninghaus, Palo Alto Co., Iowa, had a three-year-old colt struck by lightning three weeks previous to writing. The animal was for an hour completely stunned, but has been very gradually recovering. The mouth hangs slanting to one side, and is much swollen externally. One of the eyes appears to be destroyed. His walk is staggering, and the hind legs are affected.—There is every probability that the animal will gradually regain his strength and health. The nervous system has undergone a tremendous shock, but with good care and attention, so young an animal has every chance to recover. No particular treatment is required beyond the very best of care, plenty of nutritious food, and well aired quarters, with daily long-hand rubbing of the limbs, and especially good grooming.

CONTRACTION OF THE FOOT.—C. D. Harris, Frederick Co., Va., inquires for the mode of treatment for a horse with contraction of the "coffin bone."—Contraction of the foot is a more proper designation of the condition in question, for the entire organ participates more or less in this abnormal state. Contraction is not to be considered a disease in itself, but as a result of unhealthy changes, which various causes have brought about in the foot. There is no more fertile cause for this condition, than the almost universal habit of "opening up the heels" in the preparation of the foot for the shoe. Nature has placed a strong buttress at the heel, which is formed by bending in the wall of horn towards the centre of the foot, constituting what is known as the bar. Now by cutting into this bar at the angle, this defence against contraction is very much weakened, and sooner or later, owing to this mutilation, the shape and size of the foot is altered. If the foot is to be preserved in its original normal condition, the entire lower surface, except the border of the wall, must be left untouched by knife or rasp. This cannot be too strongly insisted upon. Where contraction has already taken place, we cannot hope to restore the parts to their former condition. The treatment best suited for such cases is the removal of the shoes, and a run at grass in a wet pasture. No mechanical contrivances are of any avail.

OBSCURE LAMENESS.—P. Smith, Kent Co., Mich., has a horse that evinces lameness after a drive of five to ten miles on the road. If in pain, it stands with the right foot forward, distance in proportion to pain. Pain is produced on raising and bringing the foot forward. Has not been made lame often, or kept lame long at a time.—It is difficult to form a diagnosis from these data. If the trouble was in the shoulder or elbow joint, then the lameness would be continuous, and manifested in the walk. At the same time, the pain experienced on lifting and moving forward the limb is almost a sure indication of disease in these same joints. Rheumatic affection alone seems to answer to our inquiries, as this may attack any joint, and may appear and disappear. For treatment, use warm, stimulating lotions, well rubbed in at the seat of pain. The following is excellent: Two ounces of Hartshorn, the same quantity of Camphorated Spirit, an ounce of Oil of Turpentine, half an ounce Laudanum, mixed together. In joint rest, or very slow farm work. For a horse that will not get fat on abundance of food, change the diet completely and give less work. A run at grass for a few weeks would, in a case like the above, undoubtedly work wonders.

FRUITFULNESS AND ABUNDANCE.

Drawn and Engraved for the American Agriculturist.

Our Dog.

We keep a dog, and love him too. He is a Scotch Colley of royal mien, as seen from his portrait. He answers quickly to the name of "Rover," and has no end of admirers. The Scotch Highlands are the home of Rover's ancestors, where the Colley breed is found in its best estate. Here in the grassy valleys, and on the rocky table-lands this dog renders the labors of the shepherd profitable and easy. The pure-blooded Scotch Colley is a medium-sized dog with a clean, foxy face, half-pricked ears, bright eyes, and a shrewd expression. He has no superiors in canine intelligence. The coat is long and silky, and in color varies greatly; black and tan with a white collar, legs and belly is not infrequently seen. The fore legs are feathered, and the hind ones are short-haired below the hocks. The shoulders are deep, back rather short, and the tail long, gracefully curled up at the end and heavily feathered. The constant and intimate association with the gentle milkmaids of their native island, has molded the character of the far-famed peace-loving Jersey cow. In like manner the Gaelic shepherds have most thoroughly developed the desirable qualities of the genuine Scotch Colley. "Rover" is a living monument of the molding power of man as exercised in the development of a shepherd dog. He is not a dog for idle tricks; though fully able to learn them, he prefers to render more important service. His supreme delight is to reign at the head of a flock. There his language and movements are better understood than those of his master. He guards and guides with great prudence and judgment, and only uses harsh means when peace and order demand them. His good disposition quickly gains him the confidence of the flock in his charge. The Colley resents changes of ownership, but is most faithful to a time-tested and beloved master. Wherever sheep are kept, the Colley is useful. The good services he will render are without number, and many of them prove the possession of a high order of intellect. The achievements in herding wild sheep at the prize competitions are simply wonderful. We do not know the full extent of "Rover's" abilities, but it is certain that he is an important fixture of a farm that is well regulated in one particular at least—the possession of a faithful, thoughtful, labor-saving, peace-loving, affectionate, and handsome Scotch Colley dog.

A Swine Feeding Pen for Corn.

A convenient corn pen which we have used in our fattening lot for swine is shown in the engraving.

A PIG-FEEDING CORN PEN.

It is used for corn fed directly from the field. In the center of the feeding floor four stout forked posts are set at the corners of a square, the sides of which are eight feet long. The forks support two poles, and on these is placed a floor of planks or rails, with a square rail pen upon it a couple

of feet high. The posts should be just long enough to admit the hogs under the pen. A wagon load of corn, when gathered, is thrown into this pen. As the corn remains in the pen only a short time, no roof is necessary. The pen can easily be made to hold one hundred bushels, if desired. As the hogs can get under the pen no corn is lost by falling through the floor. There is no loss from rats and mice, as they cannot burrow under the pen. The farmer can stand in the pen and throw

OUR SCOTCH COLLEY "ROVER."

Engraved for the American Agriculturist.

the corn by handfuls on the feeding floor, without striking the swine. The flesh of fat hogs is easily bruised. The corn can be assorted as it is fed to the pigs, the bad ears being thrown into one corner. It is easy to unload the wagon into the pen, and as one is about on a level with the other, the corn shells but little when thrown into the pen.

The posts must be stout and set well into the ground, otherwise the corn may break the pen down upon the swine. If the posts are set shallow or loosely, the hogs will rub the pen down. Pens like this are sometimes set upon stones, but we cannot recommend this, as the hogs are liable to bring the structure down upon themselves by scratching against the stones of the foundation.

What Crops shall we Gather First?

Every farmer at this season of the year frequently asks the above question. A few suggestions will not be unacceptable—even to the writer! It is a fact that no matter how old a farmer may be, and how much experience he may have had, he will often find it to his advantage to set down with a paper and pencil, as we are now doing, and think out a question of this kind, and write down his conclusions. We have been farming for half a century, but could not off-hand tell you which crops to harvest first, or what job it is best to go at on the morrow. Let us think a moment. Of all the root crops, parsnips and salsify are the hardest, and beets and mangolds the tenderest. Beets either for the table or stock, and especially if any of them are to be set out for seed, should be gathered before a severe frost. If the crop is growing vigorously, and the leaves full of sap, a slight frost will bring no harm, and even a severe frost will do comparatively little damage. The leaves protect the roots. Nevertheless it is well not to run too much risk. After the first of October the farmer who has many beets or mangolds to harvest, should keep a close watch of the daily weather report, and if a severe cold wave or frost is approaching, harvest the crop. If in a hurry the roots may be drawn into heaps, tops and all, and covered with a little straw. In fact, little damage will be done if the heaps are not covered at all.

He must not forget the apples. On our farm we are generally picking apples and harvesting beets at the same time. When dry, pick the apples; while the dew is on gather the beets or pick up the windfalls. As a rule, many farmers gather their winter apples too early. So at least the buyers tell us—but then they have not to run the risk of a high wind blowing off the fruit. Greenings should be picked before the Baldwins and the Northern Spies and Russets last. We usually let the cider

apples hang as long as they will, or until the buyers want them. Autumn pears should be gathered as soon as the stems, when the pears are lifted, part readily from the branches; winter pears are rarely allowed to remain hanging on the trees too long.

Cucumbers for pickles should be picked at least twice a week as long as they last, and as soon as they are large enough. Make sure of enough for your own use. Some morning you will wake up and find the cucumber pickle business ended for this year. Winter squashes can remain out as long as the fruit is covered with leaves.

Onions, if you are unfortunate enough to have any still in the ground, should be pulled and dried on the land in the field, or spread out on a floor.

After these crops are attended to, we can suit our own convenience as to whether we shall first dig potatoes, husk corn, or pull carrots. It is a

question of weather, convenience and condition of the land or marketing the crop. He is a fortunate farmer who keeps up with his work at this season. Turnips and cabbages stand quite a freezing. Celery, earthed up, is rarely injured before Thanksgiving.

Salt and Ashes for Swine.

At all times, but especially when fattening, hogs should have a constant supply of salt and clean wood ashes. When kept continually before them, they will not eat too much salt. It is only when deprived of salt for some time that swine will take it to excess. The engraving shows a very convenient arrangement for providing hogs with salt and ashes. It is an ordinary box with an opening left all around at the bottom. This opening should be three inches wide, with slats nailed across it from two to four inches apart, making a succession of holes. The box is partly filled with salt and ashes mixed, and firmly stamped in the box.

A SALT AND ASH BOX.

The hogs will lick the mixture out through the holes along the bottom. A roof of boards, not shown in the cut, is placed over the box to keep its contents dry. The more charcoal in the ashes the better. Salt assists in the digestion of the food; ashes rid the intestines of worms, and strengthen the appetite. Hogs must have an abundance of water.

Farms and Gardens in New York City.

There are many lanes on the maps of the City of New York, but the only thing rural about them, is

themselves in the country, until the jingling street cars, or the clanking elevated trains, dissipate the pleasant fancy. Beyond the Harlem River, and still within the city limits, which extend for four

the owners of the land. They commonly hold it on long leases from old estates, and as the leases expire, the owners oust the tenants, and build at once. In consequence of this, you will often find an enormous French flat towering alongside of a picturesque little cottage, or a rude shanty. There is one spot where a vast flat occupies each corner of a block, and between the two is an old farm house, shaded by huge elm trees, and with its narrow strip of land covered with hot-beds, running through the block from street to street.

Apart from the real city farms, there are whole blocks of waste land, so rocky as to be useless for the cultivator, on which the famous squatters of the metropolis have built up that curious community known far and wide as Shantytown—a collection of huts built in the rudest and cheapest way, chiefly of odds and ends of lumber. Its dwellers are laboring men, carters and the like, humble, but useful toilers. The principal industry of Shantytown is goat-breeding, and since goat's milk has become a fashionable beverage, the bulk of New York's supply comes from here. With the great activity in building, however, Shantytown is steadily and surely becoming a thing of the past.

One of the most curious of our city farms, is that of the Penitentiary on Blackwell's Island. On it are raised the vegetables used in the prison. The warden of the Island is the farmer, and the convicts his laborers. They present a melancholy appearance in their striped suits working among the fields, but not nearly so much so as do the lunatics on the Ward's Island farm. These poor wretches are employed in the kitchen garden of the asylum, and the doctors say, the air and exercise are highly beneficial to them. Another very odd farm is on a rock in the East River, near Hell Gate. It is about half an acre in extent, and from the vegetables produced, and the fish caught,

the family who have lived here for over forty years, subsist. These hermits of the metropolis, are a brother and two sisters. They live in their little castle surrounded by the waters, and apparently enjoy life thoroughly.

We can include, in the bucolic category, the pumpkin patch in the Tombs prison yard on Centre street.

OLD FARM HOUSE IN MANHATTANVILLE.—Drawn and Engraved for the American Agriculturist.

their names. There are, however, in this city of wonderful contrasts of the miseries and splendors of modern life, certain spots in which nature still lingers. Our city farms are not nearly as numerous now as twenty years ago. Then you could find them below Fourteenth street, and in the quiet by-ways of the old Ninth ward. But there are some left yet, even in the heart of the city, and within the far-reaching limits of Gotham, thousands of acres still return their yearly crops in produce instead of rents. There are old farms and peaceful pastures, and among them people who lead pleasant rural lives, envied by the turbulent multitude that pursues fortune with a feverish fury, in factories and stores, and the great marts of commerce and speculation. People who are not New Yorkers, picture the metropolis as one monumental mass of brick, and stone, and iron, with enough timber thrown in here and there, to make a roaring fire once in a while. They know that there are some parks, great and small, among these rows of houses, but there, as far as they know, the touch of nature which brightens and purifies the city, ends.

Among the rocky undulations of Manhattanville, agriculture still holds its own. There is quite an extensive settlement of market gardeners on the west side of the city, between Central Park, and the North River. There are farmers here who live in the same houses, and till the same soil their grandfathers lived in and tilled nearly a century ago. The improvement in the city has made their land worth as much a foot, as it once was worth an acre. The old farm-house at Manhattanville, the district above Central Park and near the Hudson River, the picture of which we present, was built over a hundred years ago. Two miles further on, at Washington Heights, the upper end of Manhattan Island, is Snider's Lane, a country road around the side of a hill, with a great row of tenement houses and French flats at one end of it, and a cornfield at the other. Within a quarter of a mile of Snider's Lane, the life of the metropolis bustles and seethes. From its highest point you can see the myriad gas lamps and the electric lights of the city gleam and flash at night. Yet for half a mile or so along its peaceful length, you may wander in solitude, and forget, amid the rustle of leaves, and the songs of birds, that there is such a place as New York. Washington Heights is full of nooks where a metropolitan dweller may be surrounded by quiet rural life. The denizens of certain sections of Harlem can look out of their windows in summer, and imagine

miles and take in the village of Fordham, perched on its wooded hills, New York exhibits a strange alternation of city and country. A couple of minutes walk from High Bridge, in full sight of its crowded picnic gardens, overlooking the Harlem filled with pleasure boats, and with rows of houses along the main road, the solitary little lane of which we present a sketch, leads to a farm as solitary, and out of the way among its orchard trees, as if it was in the Berkshire Hills. The family who occupy this farm, have lived here since the commencement of the present century.

Jerome avenue is one of the liveliest thoroughfares in New York. It leads from the Harlem River at McComb's Dam bridge, to the famous Jerome Park Race Course, near Fordham. Yet there are scores of farms whose lanes lead out into the bustling street. One of these farms is quite famous for sheep, and on others blooded horses and cattle are raised. One of the loveliest lanes in the city is along Jerome avenue, leading over the Fordham Hills towards the old city of Yonkers. Fordham itself, which is the upper ward of the City of New York, some fifteen miles from the City Hall, is full of charming bits of rural scenery. In Tremont, still nearer the city, in Morrisania and Mott Haven, you find the country elbowing the city. Below the Harlem River, where land is more valuable, the city farmer cultivates vegetable crops. On the other side he grows larger produce. The gardeners south of the Harlem, are not, as a rule,

SNIDER'S LANE.—Drawn and Engraved for the American Agriculturist.

Among the Farmers.

New Series.—No. 6.

BY ONE OF THEM.

A Rhode Island Coast Farm.

A few weeks ago I passed over the farm of a sea-shore farmer in the township of Westerly, Rhode Island. It is a neat, well-tilled farm, made rich with sea-weed and good cultivation. Many tons of kelp and rock-weed are annually thrown up by the sea upon the beach, and harvested as carefully as if it was hay. This goes into the pig pens and compost heaps, and then out upon the land, which is chiefly used for growing hay, though I saw an even field of corn and good oats. The meadows are thus made "permanent" for many years, and the hay, chiefly timothy and red-top, with a sprinkling of clover and some other grasses, is of excellent quality. The farm is divided irregularly into little four to ten-acre lots by stone walls, and on even the smoothest fields the boulders, or granite ledges, occupy a considerable percentage of the land. The outline of the farm, though I believe "all in one piece," is of astonishing irregularity, being cut into by bays, and coves, so that I have no doubt there are places where three or four rods of fence would safely confine cattle upon a plot of eight or ten acres. These inlets and coves are full of fish and oysters, so that luxuries are not wanting. The pasture land is largely given up to huckleberry bushes, with bayberry and low blackberries. Even this is not altogether poor farming, for it is claimed, with some reason, that a "huckleberry pasture" stands the drouth better than one from which the bushes have been all cleared off, and the hills left bare and exposed to the full burning heat of the July and August sun.

Here and there, in low places between the rocky knolls, ponds of fresh water occur of a quarter acre to several acres in extent. Many of them are within a few rods of the sea, and about the same level or a little higher. In dry weather, their level is often below that of the ocean at high tide. These afford water for domestic and farm uses, practically inexhaustible, and are scattered conveniently about the farms. Hollows, which ages ago contained such ponds, but which are now filled up, possess the richest soil, admirable for gardening, and in all the hollows and swales which are dry, very fine, rich, dark soil occurs, in which apple and other fruit trees do very well, sheltered as they are by the hills or knolls. In exposed places, the only trees that I noticed were stunted and gnarled cedars, stumpy wild cherry and pepperidge trees, and even these were huddled under the shelter of big rocks, or crowded close to one side of a pool, which shows how severe the brine-laden, wintry blasts must be.

Sheep Culture.

Sand dunes and rocky grazing lands are admirable for sheep, and it seems strange that so few are kept on the Rhode Island coast. Sea-side resorts along the coast bring consumers, who are willing to pay the highest prices for good lamb and mutton, to the farmer's very door. It would seem that a medium of business enterprise would induce the farmers to respond to this demand, at least rather than sell their hay, but the "good old way" of doing things is preferred to the extra dollars.

An Old-fashioned Dairy.

In this scrupulously neat and well scoured dairy, the only modern innovation was a Blanchard churn, unless indeed an ice-house beneath might be counted as one. Long rows of shining tin pans occupied the shelves, and in the cheese-room there was pleasing evidence, that the art and mystery of cheese-making in private dairies was not altogether a thing of the past, and like spinning and weaving turned over to the factories. Here were twenty to thirty-pound cheeses of all ages, full milk, half-skim and sage, of excellent flavor and texture, curing, ripening, and keeping, no doubt finding an appreciative market, a few at a time, among the hotels, which in the height of the season take the milk, so that cheese-making is un-

necessary. I could but think what an amount of hard labor would be spared that hard-working, thrifty housewife, if only the modern practice of deep setting could be introduced. The view seems to prevail, that though this may be very well adapted to factories, it is not the thing for private dairies.

Treatment of Milk in the Household.

Thousands of country people, who have had to do with milk all their lives, have no idea that modern notions about handling milk are in any way applicable to their circumstances, or could be employed by them if they wished without great expense. The fact is however quite the contrary. The butter comes with difficulty in cold weather, is lardy, and of a poor flavor. It meets with a poor market anywhere, and is only taken at the country store in order to secure the housewife's trade for groceries. She certainly takes pains enough—good, thrifty soul. The milk is set in flat pans, brought in from the milk-room to the store-room for fear of its freezing, and even brought out at night into the living-room to keep it at a proper temperature. Nevertheless the butter is rarely even passably good, and there is a great deal of work about it. So the good people let the cows go dry in winter, simply to get rid of the care of the milk, and of milking in cold weather. Now the fact is, the cream will rise in deep vessels more perfectly and of better quality in twelve to twenty hours at a temperature of forty-five degrees, than it will in two days in flat pans at a temperature of sixty degrees. Flat pans in common use hold five or six quarts. The deep milk "coolers" hold about sixteen to eighteen quarts. They may be set or floated in a small pool, or box, or tub of water, and only three milkings are ever in the pool at once, while the milk should stand in the flat pans two days or more.

To set thirty quarts of milk two coolers would be needed, as against five pans and probably six, required on the old plan of setting. The washing of this quantity of tin ware is a great item, and considering the little satisfaction given by the butter, it is no wonder that the small farmers let the cows go dry all through the winter months. It is a very easy thing to arrange a "pool" for a few coolers. I have a dry-goods' box set close to the out-cropping of a spring. The water fills this to the height of twenty inches. In it tin-coolers holding sixteen quarts of milk each will float. All the water from the spring flows through the pool, and rapidly enough to change it completely about once in ten minutes. A larger box is placed over the pool, and this has a lid which does not close perfectly tight, so that ventilation is secured. Ventilating covers are placed upon the cans. We find it works well. The milk remains twenty-four hours in the spring, and the skim-milk is blue enough.

In the winter a half hoghead tub in the outside kitchen held the coolers. This was covered with a close cover and a blanket or two in very severe weather, just to keep the water from freezing too much. Last winter we used a Moseley's Cabinet Creamery, which proved very satisfactory and convenient. A little ice in the water is a good thing. The water must be changed frequently, especially if any milk is spilt into it. In winter it is just as well to skim at twelve hours as at twenty-four. The amount of work thus saved by using some deep-setting plan is very great, besides the cream is sweet and pure, having absorbed no odors from the living-rooms, or from the cooking. The skim-milk is sweet and good for every household use, and the butter comes quickly and well, and is worth something when you get it.

Fish Ponds—Carp.

Some of the ponds which I described are very deep, others are shallow and proportionately warm. The deep ones are probably adapted to black bass raising, and the shallow ones, many of which have a fringe of swampy land and shoal water filled and covered with confervous vegetation and swarming with minute animal life, are certainly admirably adapted to the growth of the German carp.

These fish are said to grow to a large size only in warm waters in which subaqueous vegetation

abounds. This is their chief food, and the warmer the water is the better they thrive. I took the temperature of some of these ponds, and to my surprise found it at about ten o'clock in the morning of a partly overcast and altogether hazy day, and after a week of unusually rainy and cool weather, to range from seventy-six degrees in the coolest and deepest spots which I could conveniently reach with a thermometer attached to a ten foot pole, to eighty-six degrees. Eighty-three degrees to eighty-six degrees were, I found, the prevailing shoal-water temperatures. I shall be disappointed if these ponds do not prove admirable places for European carp. Great numbers of these have been distributed free by the Government, as the *American Agriculturist* has repeatedly stated.

The carp, as is well-known, is not a native fish of this continent. It is easily domesticated, is very hardy, and easily reared, and bears the winter well in waters which do not freeze over too solidly and remain so all winter. They need occasional thaws to enable the water to absorb oxygen from the air, or for some such reason. The weather along the coast being much more variable than it is inland, would probably give open weather and thaws enough to keep them in the best condition. They do admirably in some of the Long Island ponds, which, so far as I can judge, are not so well adapted to their culture as these.

The carp is highly valued in Germany, and as cooked and prepared by the Germans, is very good eating. It is, however, far from a first-class fish, and will be despised by our shore-dwellers, who have been brought up on blue-fish, black-fish, sea-bass, striped-bass, all first-class fish, to say nothing of porgies, weak-fish, and mackerel, which are so abundant they are not valued as they should be. Nevertheless the carp will sell well. Some are now finding their way to the New York markets, and are eagerly sought for. The fish usually sold as carp to the unknowing is a chub-sucker, caught in the great lakes, a soft-fleshed fish, not nearly so good as the German carp, and quite bony.

My visit to the farmers of the Rhode Island Coast has taught me many things that is not easy to set down on paper. Visiting may be profitable in more ways than one.

The Leaf-Rollers of the Apple.

Il. D. Barber, Bergen Co., N. J., sends us some apple tree leaves which are curled up at the edges. This is evidently caused by one of the leaf-rolling caterpillars, which drew the leaves together. There are several leaf-rollers, which work upon the leaves of our fruit trees, sometimes young apple trees ap-

APPLE LEAF-ROLLER INSECT.

pear as if the foliage had been scorched and curled. Upon examination this will be found due to a small "worm" or caterpillar, which has drawn the leaves together to form a shelter under which it may feed unobserved, and where it may form a chrysalis and undergo its changes. The caterpillars are very lively, and when alarmed let themselves down by a thread, as shown at *a*, in the engraving. The leaves are folded up to furnish a hiding place, as shown at *d*. When full-grown, the caterpillar forms the chrysalis, *b*, from which, in time, comes forth the dark-gray moth, *c*. The lines in the engraving show the actual sizes. The insect here figured is *Tortrix Cinerella*. There are several other species of the genus *Tortrix* with similar habits. Hand-picking, at its first appearance, is the best remedy.

Law for Farmers—Hiring Farm Help.

HIRING MINORS.—A great many farm hands are minors, under the age of twenty-one. Such persons cannot make a contract, which will be binding upon them, except for necessities. Because of their inexperience in the sharp conflicts of business, the law relieves them from the obligation of keeping their agreements if they wish to avoid them. Consequently if the farmer hires a hand, under twenty-one, to work one year, or any definite time, and the hand leaves just before harvest, without legal cause, or simply because he can get more wages elsewhere, the farmer cannot keep any of his back pay, or in any way get damages for the minor's breach of contract. Under such circumstances the minor will be entitled to the amount due him at the rate he hired, or, if he thinks he hired at too low a rate, he can throw up the contract entirely, and recover from his employer what his services are actually worth.

There is another consideration with respect to the hiring of children, more important than the foregoing. Parents, being under obligation to support and care for their children, are entitled to their services until they are twenty-one years old; or, if the children work out, they are entitled to their wages until that time. When therefore the farmer hires a hand under twenty-one, he must see to it that he pays the wages to the party to whom they belong; otherwise he may have to pay them twice. Unless the child has been emancipated, that is, has had his "time" given him, payment to him will not generally prevent the parent from collecting payment again. If the child falsely represents himself to be of age, or emancipated, such fraud will not prevent the parent from collecting his wages, or the value of his services.

A child may become emancipated by agreement between himself and parent, by the parent's casting him off to shift for himself, by the parent's absconding to parts unknown, or by the parent's becoming so poor as to be unable to care for the child. In all of these cases the child becomes entitled to his wages, may sue for them if necessary, and recover the amount due him at the rate he hired, or may throw up his contract and recover the actual value of his services. There is a growing tendency among American Courts to favor children who are trying to earn an honest living for themselves. This tendency is in keeping with the spirit of our free institutions, and the child will generally be given the right to his wages whenever there is any show of authority for it. The Courts of some of the States have gone so far as to hold that where the parent permits his child to go and hire out by himself, and to receive his wages without objection, that the parent then loses his rights in the premises, and payment to the child discharges the debt. The statutes of some of the States have regulated the matter by providing that unless the parent gives notice within a certain time to the employer that he claims the minor's wages, he loses his right to them. In New York, notice must be given within thirty days of the date of hiring.

FARM APPRENTICES.—Apprentices are persons "bound" to another to learn a certain trade or business. They are more common in the mechanical trades than upon farms, but the law governing them is equally applicable to all kinds of business. A boy may be bound out upon a farm until he is twenty-one by a written instrument called "Articles of Apprenticeship," which must be entered into by the minor and his parent or guardian, or by the minor with the written consent of his parent or guardian, and which then becomes binding upon him and upon his master, until the apprenticeship expires. If either party fails to live up to such articles, he becomes liable to the other for the damage so caused. Such articles must conform to the local statute governing the matter, be in writing, and under seal, must generally be made in duplicate, and in some States recorded. It is the duty of the master to instruct the apprentice in all the knowledge of the craft or business which he has undertaken to teach him, to watch over his

conduct, give him good advice, set him a good example, be kind to him, employ him only in the trade he is to learn, and keep all the covenants undertaken by him in the articles. It is said he may moderately chastise him if necessary, but here he should let his moderation be known. It is the duty of the apprentice to obey the master's lawful commands, care for his property, promote his interests, learn the trade or business, stay the term out, and perform all the covenants undertaken by him in the articles. If the apprentice works for third persons the master is entitled to his wages or value of his services just as a parent is in case of a minor. It is the duty of the parent or guardian to inquire into the treatment of the apprentice, and to defend him from all cruelty, neglect, or breach of covenant on the part of the master. There are in most States statutory regulations for the binding out of orphans and poor children by certain public officials. In such cases, such officials stand in much the same position as parents or guardians.

Good and Bad Road-Building.

Nothing is more destructive to horses and vehicles than a road full of ruts and loose stones. A single stone, which might be removed from the road-bed in a half minute or less, often remains and

Fig. 1.—BADLY MADE ROAD-BED.

is struck by a dozen wagons each day, for perhaps a year. Many of these loose projecting stones come up from a lower stratum of the road-bed, where they were improperly placed. Figure 1 represents a section of a faulty newly-formed road-bed. A layer of irregular stones of various sizes is placed a few inches below the surface of the intended road-bed, and a covering of sand and clay scattered over it.

Fig. 2.—BAD ROAD-BED AFTER HEAVY TRAVEL.

The wheels of a heavily-loaded vehicle, quickly cuts through to the layer of loose stones, and shortly the roadway presents the appearance shown in figure 2. The stones, large and small, are constantly being worked toward the surface, where they form annoying obstructions. Figure 3 shows a superior method of arranging the material for a good road-bed. Durable stones from four to six inches in diameter, are set in the bottom by hand,

Fig. 3.—ROAD-BED WELL MADE.

with their largest sides downward, and secured in place by smaller stones above and between them, thus forming a compact layer of six inches or more in thickness. With such a foundation, and a suitable covering of fine broken stone, a road-bed is formed that will be smooth, hard, and durable. Road-making needs to be a permanent improvement, or else it is seldom a paying investment.

LOOK TO THE LABELS NOW.—The labels attached to the trees are not intended to be permanent. When the trees are planted with these, by the time they begin to bear, the labels will be lost or can not be read. If the wire to these labels is strong, the tree, as it grows, will be constricted by it, and a branch, or sometimes the whole top, be killed. Those who have planted trees with the nursery labels still attached, should lose no time in replacing them by others. Among the many kinds of labels, one of the best is of sheet zinc, cut in the form of a long, tapering wedge, an inch or so wide at the base, and six, eight, or more inches long. The name of the variety is to be written upon the broad end of the label with a common lead-pencil, and the narrow end loosely coiled around a small branch, in such a manner that it will yield as the branch en-

larges. The writing in pencil on the zinc label is very permanent: we have known it to be legible after an exposure of twenty-five years.

Recent Experiments in Crop-Feeding.

Paul Wagner has compared the feeding capacities of peas and barley, by growing these plants in zinc vessels and under various conditions. The cans were filled with thoroughly mixed, sifted soil, and the contents differed only in the manure supplied. There were eight vessels in the series. The manures added to each can is shown in the subjoined table:

No.	Manuring.	Peas.	Barley.
1	Nothing.....	100	100
2	Nitrogen.....	104	113
3	Potash.....	109	107
4	Phosphoric Acid.....	126	113
5	Phosphoric Acid and Nitrogen.....	132	146
6	Nitrogen and Potash.....	102	121
7	Potash and Phosphoric Acid.....	147	126
8	Potash, Phosphoric Acid and Nitrogen.....	151	181

Each series was duplicated, and the above is the average result. The crop with no manure was taken as one hundred. Nitrogen, as nitrate of soda, was added in each case at the rate of thirty-five pounds per acre; potash as chloride, seventy pounds, and phosphoric acid as superphosphate, eighty-seven and one half pounds per acre. By comparing the cans having nitrogen with the others, it is evident that nitrogen had very little effect upon the peas, while with the barley the results are remarkably beneficial, ranging from thirteen per cent when the nitrogen only was added to fifty-five per cent when applied in combination with potash and phosphoric acid. Manuring with potash and phosphoric acid brought a gain of forty-seven per cent to the pea crop, only a little less than when the nitrogen was added (No. 8). The soil nitrogen was sufficient for the growth of the peas, while it did not supply the needs of the barley plants. Stated in another way, the facts are still more striking: The potash and phosphoric acid brought twenty-six per cent more dry matter, and this gain contained .06 grain of nitrogen. The addition of .2 grain of nitrogen in the soda salt gave an increase of eighty-one per cent of dry matter, and .18 grain of nitrogen. It is seen that nearly all the nitrogen was recovered in the crop.

These experiments show, that peas are much better able than barley to assimilate the nitrogen of the soil. The pea crop in the experiments contained between three and four times as much nitrogen as the barley plants, but this does not indicate that peas should have more nitrogenous manure than barley. Peas can obtain their supply of nitrogen from ordinary soil, and respond freely to applications of potash and phosphoric acid. Barley, on the other hand, though needing comparatively little nitrogen, obtains it with difficulty, and is greatly benefited by nitrogenous manures. These experiments do not agree with the idea that crops should be manured with those elements of plant food abundantly found in them by analyses.

Peas are closely related to clover, both belonging to the legumes, and barley is a first cousin to wheat. The facts here presented accord with those determined by experience, experiment, and analyses regarding clover and wheat. Clover does not respond quickly to nitrogenous manures, though containing a comparatively high per cent of nitrogen in its composition. Wheat, requiring only a little nitrogen, is not able to obtain that little easily, and is much benefited by the applications of soluble compounds of nitrogen. It is easy for clover to get its large amount of nitrogen, while it is difficult for the wheat to obtain its small per cent of the same element. The conclusion here obtained is opposed to the use of the so-called special manures made for any particular crop.

A WOODEN BIT FOR SUCKING COW.—Mr. David Strang, Lincoln Co., Tenn., writes us that some time ago he read a description of a "bridle" to prevent a cow from sucking herself. It was made of a piece of gas pipe. Recently he had use for such a device, but was twenty miles from any gas pipe. He punched the pith out of a stout section of an elder stem, and ran a large wire through it. The ends of the wire were fastened to the headstall.

The Ox Gad-Fly.

The genus *Tabanus* includes several flies with powerful biting and sucking mouth-parts. Horses and cattle are sometimes worried to death by the harassing, painful bites of these pests. They only do harm in the perfect or fly state, by drawing blood from their victims. The true gad-fly has nothing to do with producing the maggots in the

THE OX GAD-FLY.

backs of cattle, or the bots in the internal organs of horses. The larva of the gad-fly lives in the earth, upon decaying vegetable matter, and possibly on snails, and the young of other insects. The proboscis of the gad-fly contains an organ having sharp lance-like points, with which the fly pierces and draws blood. Like the mosquito, the male gad-fly does not goad its victims, but lives on the sweets of flowers, the female only being provided with the piercing and sucking apparatus above mentioned. The engraving shows a back and side view of the Ox gad-fly, somewhat magnified.

Shropshire and Hampshire-Down Sheep.

The Shropshire and Hampshire-downs are two essentially modern breeds of English sheep. The desire to improve all kinds of live stock took possession of progressive English farmers during the latter part of the eighteenth century. The Wiltshire sheep were a hardy, horned, white-faced breed, which, when crossed with the improved hornless, dark-faced, well bred Southdown, became a profitable market breed, especially for raising early lambs, and their wool was also greatly improved. This cross, with a dash of Cotswold or Leicester blood, is the foundation of the Hampshire-downs. They had been bred for black or dark faces and legs which were Southdown characteristics, but when Southdown breeders found the Hampshires competing with them in the market, and successfully, from their larger size, they changed in a measure the fashion of color in their legs and faces, now-a-days preferring the grizzly-brown rather than very dark. The Hampshires are larger, coarser, and not so well formed as the Southdowns, and their wool is longer and coarser, doubtless from the long-wool cross. They mature early, and are hardy and profitable. It takes a good judge to tell the difference in the quality of mutton, but the smaller Southdowns make the best.

The Shropshires were produced in a similar way from the old Morfe-common breed, but contain more long-wool blood. In size, they are fully equal, if not superior to the Hampshires, and are their equals in easy fattening, early maturity of lambs and profitable fleeces. The wool being fine, though of longer staple and more glossy than the true Downs. This breed seems now to be well established, and rapidly gaining in popularity. It has spotted or grayish faces and legs, with a carcass somewhat resembling the long-wools. We are asked: "Which of these two breeds is likely to become the most popular?" That depends entirely upon the breeders. These breeds do not stand still, even for two or three years. Energetic and

intelligent breeders are all the time improving their flocks by selection, and by crossing with the best rams they can buy or hire. Thus there are constant minor changes which affect the breeds, while the efforts of prominent breeders are to make their own breed fashionable, or at least the more prominent. It is therefore quite impossible to predict the popularity of any one of the established breeds of cattle, sheep, pigs, or poultry, as it depends much more upon the success of breeders in their tactics than upon the merits of the breed itself. The mutton of all these improved mutton-breeds, both middle-wools, downs, and long-wools, sells much better than that of the fine-wool breeds.

A Rare, Useful, and Ornamental Grass.

The Tall Oat Grass, or Meadow Oat Grass is a species that has given the greatest satisfaction wherever it has been tried, yet we rarely see it in cultivation. It is admitted on all sides to be vastly superior to Timothy, yet our farmers have been so long accustomed to that grass, they will not give it up, even for a better one. The tall oat grass was formerly placed in the same genus with the Oat (*Avena*), but as it differs in the structure of its spikelets, it is now called *Arrhenatherum*, a name that signifies that the male floret only bears a bristle or awn, in which particular it is unlike the oat. The grass is usually from two to four feet high, though on rich land it reaches five to seven feet. It starts early in spring and continues its growth until late, and is noted for the abundance of its aftermath. It is equally valued for hay, and as a pasture grass. The late Mr. Howard said of the tall oat grass: "It deserves to be placed at the head of the winter grasses for the South.... The amount of green food yielded by this grass during the winter is greater than that of any other grass." For soiling, it allows of three abundant cuttings

THE TALL OAT GRASS.

during the summer. This grass has been tested by experienced farmers in New York, Pennsylvania, and Virginia, all of them assigning to it a greater value than Timothy. It may be sown upon wheat in the fall, or may be sown by itself in early spring.

The seed is very light, and not less than two bushels should be sown to the acre. The tall oat grass is one of the kinds cultivated for ornament in England. If cut early and dried in the shade, the panicles are very pleasing. Besides the names already given, this grass has been called "Pervian-grass," and "Grass of the Andes," names to which it has no claim, it being a native of Europe.

A FODDER-SAVING MANGER.

Manger for Cattle.

Mr. J. W. Darrow, Columbia Co., N. Y., sends us a sketch of a feeding manger, shown in the engraving. The bottom of the manger may be slightly elevated above the stable floor. The front of the manger is boarded up with the exception of a V-shaped opening four inches wide at the bottom, and two feet at the top. The side-pieces, *b, b*, are three by four-inch scantling; a ring, *c*, furnishes a suitable tying place for the halter. It is impossible for a cow to throw hay out under her feet when feeding at a manger of this kind. The quantity of fodder wasted, when fed from a poorly constructed manger, amounts to much more, in a single year, than the cost of one properly built.

Mushroom Growing.

Mushrooms may be grown in almost any place that furnishes a rich and moist bed, and sufficient heat for the subterranean portion of the plants. Mushrooms have no use for sunshine. They are very extensively grown in large caves near Paris. Any low, propagating house, or even a cellar, the air of which can be kept charged with moisture will answer. Well fermented stable manure is best suited for furnishing the nourishment and required artificial heat for the plants. From one-fourth to one-third of dry loam should be mixed with the manure. The bed needs to be from a foot to eighteen inches thick, flat, and thoroughly packed. When the temperature of the bed is about seventy degrees, usually a week or ten days after being made, the spawn is introduced. Two inches of the surface of the bed is removed, and pieces of the spawn are scattered over the top, patted down with a spade, and the surface material returned. By spawn is understood the fine filaments of the mushroom, that have been dried in "bricks" of earth. In somewhat the same manner yeast is preserved in a dry state. The subsequent work of the mushroom bed will be the gathering of the crop, adding liquid manure occasionally, and keeping a moist atmosphere and an even temperature.

Mushrooms have been grown on the floors of cellars in conical beds, in tubs and casks, in stables, railway arched, and in beds in the open ground. In short, mushroom-growing requires no greater skill than that possessed by the ordinary gardener directed in a particular direction. The mushroom spawn is usually kept for sale by seedsmen, and a small amount for a trial bed can be procured at little expense. There is always a quick market for fine mushrooms in the large cities.

Our Most Valuable Insecticides.

In answer to several inquiries for a list of the leading insecticides we say, that there are six substances now generally in use, viz: tobacco, soap, hellebore, arsenic, petroleum, and pyrethrum. The effective part of tobacco is the narcotic principle called nicotine. The vapor of tobacco is found more effective and less injurious, than either tobacco smoke or a decoction of the stems. The tobacco stems are used like a mulch in the garden, or scattered on the green-house plants. Soap is one of the oldest remedies. Hellebore, the root of *Veratrum album*, ground to powder, is useful for only a limited number of insect pests. It is the best remedy for the currant worm, and most of the saw flies. Arsenic is employed as Paris Green or London Purple, and is very effective wherever it is safe to use the deadly poison. Paris Green became popular as a remedy for the Colorado potato beetle. London Purple, an arsenical insecticide of recent introduction, is a refuse material in the manufacture of aniline dyes. Petroleum is now being largely used in destroying insects, either in the crude state or as kerosene. Two parts of the substance are thoroughly mixed with one of sour milk, and afterwards diluted with water before spraying upon the infested plants. Pyrethrum has been in use as an insecticide for many years, under the name of "Persian Insect Powder." It is the pulverized flowers of several species of the genus *Pyrethrum*—members of the great sunflower family of plants. A species of *Pyrethrum* is now being largely grown in California, and furnishes "Buhach," the comparatively new insecticide known in the trade. The pyrethrum powder acts only by contact, and needs to be applied directly to the insects. Unlike the arsenical compounds, it is harmless to man and the larger animals. Other insecticides employed to a limited extent are sulphur; bi-sulphide of carbon, carbolic acid; soluble phenyle; camphor; coal tar and gas lime.

A New Method of Preserving Grapes in Winter.

We have already mentioned among other methods of preserving grapes, one that is practised in Europe. The clusters are left attached to the canes, and the lower ends of the canes are inserted in bottles of water, the bottles being so inclined that the clusters will hang free, without touching them. This method, which prevents the berries from shrivelling, is very successful in Europe with the exotic varieties of grapes. Our native grapes differ greatly in their keeping qualities, and while it may not succeed with all, we have little doubt that this method will preserve some varieties, and we have already suggested it as worthy of trial, if not for grapes to be marketed, at least for those for family use. An English fruit-grower has improved upon the use of bottles, and gives his apparatus in

Fig. 1.—TROUGH FOR GRAPE CLUSTERS.

the "Gardener's Chronicle" (Eng.) Instead of bottles, he makes use of troughs of glazed earthenware, which allow of more rapid handling and economizes room. The troughs are some seventeen inches long and about four inches in width and height. Along the sides, on the inside of the troughs, and at a short distance below the upper edge, is a projecting ledge, under which the lower end of the cane is caught while it rests upon the opposite

edge of the trough, and allows the cluster of grapes to hang clear. These troughs may rest upon brackets driven into the wall of the fruit room, as in figure 1, which represents a trough in section, showing the ledge, and the manner in which the

Fig. 2.—RACK FOR GRAPE TROUGHS.

cane is supported. The troughs are also placed upon racks as in figure 2. Figure 3 shows a section of a single one of the troughs upon the rack, and allows the manner of supporting the canes to be seen. The troughs used here have the ledge in the center at *F*; this allows canes to be placed upon both sides, as shown in figures 2 and 3. Of course water must be supplied as it evaporates from the troughs, and the temperature of the room should be kept as low as practicable without freezing. Those who wish to experiment upon keeping our grapes in this manner will probably find bottles the cheapest at first. Should the method we have here described be tried, wooden troughs, carefully put together, and thoroughly coated with shellac varnish, may be used, at least in the experiment, as a substitute for those of earthenware. The clusters should not touch one another.

Is Cold Water Injurious to Plants?

Those who study works on horticulture by different writers, will discover many opposing views in respect to the modes of caring for, and the treatment of plants. The proper temperature for water when applied to plants, has been frequently discussed by different writers; some contend that cool water, just drawn from a well or cistern, should never be showered upon plants, but that it should first be heated to the temperature of the room in which the plants are standing. Others, with equal zeal, claim that cold water will not injure the plants in the least, contending that the water will assume the right temperature before injury is done the plant. Now which is right? We have experimented in this matter to a considerable extent, in order to satisfy ourselves as to which of these two views is correct. In the month of December we took from our collection twelve large geraniums, and placed them by themselves in the conservatory; six of these we watered with cold water, drawn from a hydrant pipe at the temperature of forty-five degrees, and the other six were supplied with water from a barrel standing in the conservatory, and was of the same temperature of the house, that is from sixty degrees to eighty degrees. The plants watered with the cold water gave little if any bloom throughout the winter, while the six geraniums watered from the barrel grew finely, and bloomed profusely.

Always water your plants in winter time with luke-warm water, if you would have a profusion of flowers, and thrifty-growing plants. The water should be of the same temperature as the room or place in which the plants are kept. There is no theory about it, this is a practical fact.

Protecting Tree Trunks from the Sun.

Dr. Samuel Hape, a prominent horticulturist of Georgia, considers the afternoon sun as having a marked injurious effect upon the southwest side of the trunks of fruit trees. The peach, when trimmed high, suffers greatly from this cause, especially in the southern climate. The bark dries up, and unless timely protection is provided, the exposed trees slowly die from the effects of the fiery rays of the afternoon sun. The warming influence of the morning hours is sufficient to overcome the cooling action of the night, and preserve the health of the tree. The effect of the afternoon sun is very marked in blighted pear trees, the southwest side being usually first affected. Trees that are grown on hillsides sloping towards the east and southeast, are much less subject to the mysterious and deadly blight. Currant, gooseberry and raspberry plants are in like manner affected by exposure to the bright sun of the afternoon. Experiments in boxing trees, especially the cherry, have been very successful. It is only necessary to protect the southwest side of the tree trunk. Dr. Hape suggests two boards nailed together lengthwise by their edges, and placed on the west side, as being sufficient to protect the tree. Where possible, trees may be shielded by being planted on hillsides sloping to the southeast. Low limbs will furnish much shade to the trunks, and may be obtained by proper pruning. The small fruits—currants, gooseberries, raspberries, etc., can be easily protected from the afternoon sun by being planted on the east side of a fence, or other object yielding shade. This matter of the sun-killing of fruit trees demands the attention of all practical fruit-growers.

Wintering Plants in Cellars.

Many plants, such as agaves (century plants), oleanders, large cactuses, etc., that have grown too large to be accommodated in the sitting-room or conservatory, can be successfully wintered in any moderately dry, frost-proof cellar. After placing these large plants in the cellar it will not be necessary to give them any water, the object being to keep them dormant all winter, which can be done by keeping the soil as dry as possible, but not so dry as to allow the plants to shrivel, or become withered. Large plants of the kinds mentioned, often form desirable ornaments during the summer time. It is impracticable, in most cases, to bring them into the house in winter, but they can be kept for years by cellaring through the winter as stated. Large geranium, salvia, and heliotrope roots, and even tea roses, and carnations, can be kept moderately well in the cellar by trenching them in dry, or moderately moist sand. Thus many choice specimens of these plants that we are loth to

Fig. 3.—SECTION OF TROUGH.

pull up and throw away when winter approaches, can be successfully kept over until the next season. It is a needless expense to purchase a stock of new plants for the garden every year, when we can winter many of the old ones in this simple and inexpensive manner. The leaves of all deciduous plants should be removed before they are put away in this manner. The foliage should remain on the oleanders and carnations through the winter.

Notes From the Pines.

I have a fondness for the much divided foliage of the Aralias, which, as shown in our native Hercules Club (*Aralia spinosa*), produces fine tropical effects. Several years ago I set out a number under different names, but which all proved to be forms of *A. Chinensis*. Even one that came to me under the all-sufficient name *Dimorphanthus Mandshuricus*, turned out to be but a variety of the Chinese

THE NEW OREOPANAX.

Aralia. I planted them all, and now wish they were back in Mandshuria and China. A recent "Revue Horticole" gives an engraving of one of the many new plants brought home from Central America by M. Edouard André, *Oreopanax Epremillianum*, an own brother of the Aralias, and as it is likely to soon find its way to this country, the engraving may be properly reproduced. Its large divided leaves, of the richest green, give it a highly ornamental character, and Mr. André expresses the hope that it may soon be found in all the gardens near the coast in France. Beautiful as it evidently is, if it has the spreading propensities of the related Aralias, I could not be induced to plant it. The few Aralias I have are now everywhere that they are not wanted. One sent its shoots under ground for twenty feet, and at that distance then came up in a rose bed, which they bid fair to convert into an aralia bed, and the shoots appear in all sorts of unexpected places elsewhere. The aralias are not the only plants which illustrate the adage: "Too much freedery begets despise." I trust that the new Oreopanax is not a spreader, but, to say the least, it comes of a bad family.

MANNING'S ELIZABETH PEAR.

Many years ago the late Horace Greeley offered a prize for the best early and late fruits for general cultivation. Mr. Greeley's object was to afford those who knew nothing about fruits, a list to aid them in making selections for planting a few trees. The choice for the best early pear was Manning's Elizabeth. This caused general surprise. I was tolerably familiar with pears, but I did not know Manning's Elizabeth. That I might make her acquaintance, I planted a tree. I now wish that I had planted many trees. The tree bears an abundant crop yearly. The fruit is below medium size, is of great beauty with its coat of yellow, carmine,

and russet; quality best, and is ripe the middle of August. This award was made some twenty years ago; I wonder if any more trees of Manning's Elizabeth have been planted since the award, than before it? The pear has but one fault—its small size, but this may be remedied in part by severe thinning of the clusters of young fruit.

THE VARIEGATED ROSE OF SHARON.

Among all the shrubs with variegated foliage, but few hold their beauty during our hot summers.

One of the best and most permanent shrubs of this kind is the Variegated Rose of Sharon (*Hibiscus Syriacus*, var.) The one I have in mind originated with the late Robert Buist. Its leaves are margined with a very clear white, while the green portion is very dark. The flowers are so very double that they fail to open. It grows readily from cuttings, and bears severe pruning. It may be used as an ornamental edging, or as an effective line in ribbon planting. It is perfectly hardy.

HYACINTHUS (OR GALTONIA) CANDICANS.

Some European florist exhibited a bed of this interesting bulb in full bloom on the grounds of the Centennial Exhibition, where it attracted much attention. The next year I saw the plant in the grounds of a gentleman who is widely known as a horticulturist. I asked him if the bulb was hardy. "Probably not," was the reply.—"Have you tried it?"—"I have no time to waste in testing the hardiness of any plants from the Cape," was his answer.—Being from the Cape, he assumed that it could not be hardy. I left out a part of my bulbs the next winter, and found that it was hardy.

Plants from warm countries often unexpectedly prove quite hardy in our severe winters, and plants that naturally grow in swamps, often flourish much better in the drier soil of the garden than they do in their native swamps. Apropos of swamp plants. There is here a row twenty feet long or more of the Cardinal Flower (*Lobelia cardinalis*) in a dry, sandy place. It is a mass of scarlet that can be equalled by but few exotics.

THE SUNFLOWER CRAZE.

The craze which started a few years ago, has not yet died out. I still see ladies using the common sunflowers as dress ornaments, or carrying them in place of bouquets. The plants are more frequently seen in gardens than formerly, and I recently passed a house where sunflowers were growing in pots. If people wish to make much of sunflowers, it seems a pity that they should select the common annual species, *Helianthus annuus*, the coarsest and ugliest of the whole genus. There are some perennial species that are really handsome while growing, and better than the common annuals are for cut-flowers. Among the best are the graceful sunflower (*Helianthus orgyalis*) and Maximilian's sunflower (*H. Maximiliani*), which are six or eight feet high, and when well grown, are fine ornamental plants. For cut flowers, the double kinds, especially that known as *Helianthus globosus fistulosus*, are vastly superior to the common one, which is only fit to grow for its seeds to use as chicken food. The first two kinds I have named, being perennial, the clumps increase year by year in size and beauty. Their foliage is pleasing.

A New and Brilliant Poppy.

The flowers of the Poppies are very short-lived, both of the annual and perennial kinds. In spite of their fugacious character, they have in some kinds a brilliancy of color, and in others a rich, crape-like texture, hardly equalled by other flowers. Poppies are not suited for cut flowers; but most useful for making brilliant the bed where they grow. The Perennial Poppies, such as *Papaver orientale* and its relatives, if given a back-ground of dark green, may be used with fine effect. The Annual Poppies, now less frequent in our gardens than formerly, are so difficult to transplant, that the only satisfactory method of treating them is to sow a bed with the seeds, and if the plants appear too thick, thin them where at all crowded. In thinning, cut or pinch out the superfluous plants, instead of pulling them, as that would disturb the roots of those that remain. There can scarcely be a more brilliant sight than a bed of the recently introduced Shade-loving Poppy, *Papaver umbrosum*. The engraving gives a single flower three-fourths life-size. The plant is from one to two feet high, with hairy stems and much-divided pale-green leaves. The flowers, sometimes four inches across, are of the richest scarlet, which is made to appear still more intense in contrast with the large black blotch at the base of each petal. The flowers last but a day, but they are produced in such rapid succession that a bed presents a continuous mass of bloom. If the plants, when young, are pinched at the top, it will make them branch, and produce more numerous flowers. Anything more brilliant than a bed of this poppy, framed in the grass of a lawn, can hardly be imagined. It is

THE SHADE-LOVING POPPY.

claimed by some that this is a variety of the well known Corn Poppy (*P. Rhæas*), of Europe, which is itself an exceedingly brilliant flower, though a weed in grain fields of England and the Continent. The Corn Poppy has given some double varieties that are very showy. Some varieties of the common garden or Opium Poppy are exceedingly double, and present a great variety of colors. If treated as above, they may be used on the lawn with fine effect.

Fall or Holland Bulbs.

THOMAS SHEEHAN.

That class of plants known as Fall or Holland Bulbs, includes hyacinths, crocuses, jonquils, tulips, narcissuses, snow-drops, and several less known kinds. These bulbs are grown in Holland in immense quantities, the soil and climate of that country being peculiarly favorable to them, and they are annually imported into this country in great numbers. Autumn is the time to set them out; any time from the first of October to the middle of December. Tulips, jonquils, narcissuses, and hyacinths, should be planted four inches deep, and eight inches apart each way; the snow-drops and crocuses two inches deep, and six inches apart. All of the above named bulbs are entirely hardy, and will stand in the ground without any surface protection through the severest winters. Some go to the trouble of covering the surface with leaves or other litter for protection, but this is entirely unnecessary. A very pretty effect may be had where one has a large number of bulbs, by selecting the different colors and planting each color in a row by itself, so that when they blossom, there will be ribbon-lines of red, white, blue, or yellow, as the case may be. Or, if one has a large number of beds of different shapes, cut so as to form a design of some kind, each section may be planted with a different color (hyacinths are the best for this work), and when all come into bloom in April, the effect will be most charming. We tried this "massing" of the differently colored bulbs one year, in a "design" of one hundred different sections of all conceivable shapes, planting the bulbs so that when in blossom, the whole would present a harmonious effect. It would be hard to conceive of a more attractive sight than that presented by all those bulbs in full bloom in early April, when every thing else looked barren and cheerless. They were admired by every one who saw them. Bulbs of this character bloom and pass away in season to allow room for other plants to be set out. These may be set between the rows of bulbs, and not disturb them in the least. Any of the above named bulbs are especially desirable for house culture in winter.

Make an oblong box, say four feet in length, fifteen inches wide, and twelve deep, fill this with fine, rich loam, then plant a row of hyacinths in the centre, and on each side of this plant a row of either snow-drops or crocuses, water thoroughly, and set away in a dark, cool place. In three weeks remove the box into the full light, water freely, and they will grow and bloom throughout the winter. If the box can be set near a front window, the flowers will make a pretty display.

These bulbs can be started in pots, or glasses filled with water, and treated in the same manner as stated above. Place a single bulb of hyacinth in each pot or glass. Four-inch pots filled nearly to the top with soil, and the bulb set in and pressed down, so that nothing but the crown is above ground, is all that is necessary. The same bulbs

can be used a number of years, but they are not so good as fresh ones, which should be obtained each year if possible. After the bulbs are through blooming, they may be left in the soil until spring.

De Lancey's Pine.

Among the noted trees in the vicinity of New York City is DeLancey's Pine. In view of the probable rapid increase of the city in the near future, a commission was appointed by the State Legislature

Fruit-Ripening and Decay.

After a fruit has attained its full size, and received from the tree all the nutriment that can conduce to its perfection, it is fully mature and then makes preparation for dropping. This is especially seen in the pear, in which the hold upon the tree, so to speak, is lessened, and if the fruit be gently raised to a horizontal position, the stem parts from the tree by a clean fracture. In the peach and some other fruits, decay soon follows maturity, while in the Russet apples it does not occur until at the end of several months. Among apples and pears we find a great difference in the rapidity with which decay takes place. In some it occurs in a few days after maturity, and it is useless to try to keep these. They are called early varieties, and must be disposed of as soon as possible after they are mature. The late varieties of apples and pears afford no exception to the statement that fruits commence to decay soon after they are mature. This decay is very slow, but not the less certain. In keeping such fruits we endeavor to retard and prolong the process as much as possible. There is a certain point in the process of decay at which these fruits are best suited for use. We call it ripeness or mellowness, and say that the fruit is in "eating condition." When fruit reaches this condition, destructive decay or rotting soon follows. After late apples are stored for the winter, the gradual decay, of which we have spoken, commences. Important changes are going on within the fruit. It absorbs oxygen from the air of the room, and gives off carbonic acid gas. Another change results in the formation of water, which is given off as moisture. The taking up of oxygen by the fruit, and the giving off of carbonic acid, in a short time so vitiate the atmosphere of the room in which the fruit is kept, that it will at once extinguish a candle, and destroy animal life. An atmosphere of this kind tends to preserve the fruit. There being little or no oxygen left in the air of the room, the process of decay is arrested. Hence it is desirable that the room be air-tight, in order to maintain such an atmosphere. The production of carbonic acid shows that the cellar in a dwelling is an

improper place for storing fruit. When the gas is present in the air in sufficient proportion, it causes death, and a very small quantity will cause headache, listlessness, and other unpleasant effects. No doubt that many of the troubles attributed to malaria, are due to the gases from vegetables and fruits stored in the cellar. A fruit cellar should be underneath some other building than the dwelling, or a fruit house may be built entirely above ground. A house to keep fruit properly must be built upon the principle of a refrigerator. Its walls, floor, and ceiling, should be double, and the space between them filled with saw-dust. The doors and windows should be double, and as light is undesirable, the windows are to be provided with shutters. There should be a small stove for use, if needed, to keep a proper temperature in severe weather.

A FAMOUS OLD PINE TREE.

Engraved for the American Agriculturist.

to select lands for public parks well in advance of the time when these pleasure grounds should be required. Among other lands selected were those bordering on the river Bronx. This is a tract, a large portion of which in its native wildness rivals the Adirondack region. Here was the home of De Lancey, whose house was occupied by Washington. Though the house has been burned, there still

"Stands high in solitary state,
De Lancey's ancient pine."

The tree has long, naked branches usually seen in the White Pine when of great age, giving it the aspect shown in the engraving, reproduced from drawings made for the Park Commissioners. It is fortunate that the conversion of this tract into a park will preserve this tree to be admired by future generations, as it has been by those of the past.

Curtain for Stained Glass Window.

The half curtain seen in the engraving, is used where the upper half of the window is stained glass, and the lower half plain. Embroider a piece of pongee for the front of the curtain, with some delicate pattern in bright shades of silk. Line it with the pongee, and finish at the bottom with

A HALF-WINDOW CURTAIN.

fringe the color of the material used, and hang it on a small rod with rings. It will work nicely on a stout wire with small brass rings, and be much less expensive than the rod generally used.

Table Etiquette.

Manners at the table depend in a great measure upon one's surroundings. The way in which food is served has an important influence upon children in the forming of their habits. A proper care in laying the table at each meal with neatness and order, with the same service when the family only are present, as when there are visitors, gives ease and manners to all, should unexpected company arrive at time of meals. A lady remarked to a friend a few days ago: "You must be very much worn out, for it is noticed that you have had company almost all the time this summer."—"Oh, no," was the reply, "we enjoy it; we never change anything, and try to have our table ready for company all the time." The spotless table linen, clean glass, and bright silver, often seen in that lady's dining room, prove her words to be true.

Americans have long been held up to ridicule by foreigners, and justly too, for their habits of "cramping" the food. This is true, not only of business men who rush into a restaurant, often standing about a counter like so many animals, waiting to be fed as quickly as possible, but also ladies and children do much the same thing at home.

A true lady or gentleman presiding at the home table, will be known by the quiet, gentle manners, together with a constant care for others, suiting each one's taste as far as possible, with few words about it. If there be a servant in waiting, she should be controlled by looks rather than words, or better, she should be so trained to her duties before coming into the dining room that she will seldom need any directions there. When the bell calls her in, she will fill each one's glass with water; then pass the butter on a small tray to the left of each one, that all may help themselves, then the bread—some cut bread in squares and place them on each one's napkin. Soup, fish, and meat, if used in courses, or alone, are served in the same way. Vegetables are placed upon the tray in the vegetable dish, and every one helps himself. Before desert is brought in, the table is

cleared and the cloth brushed free from crumbs. It is desirable that these rules should be carried out at the simplest table. If there is but one servant for all the house work, she should understand that this is one of her most important duties, and she should be required to have her hair neatly brushed, and her calico dress, collar, and white apron always ready for this service. A constant jumping up from the table by any of the family for one thing and another, is a great annoyance to all.

Breakfast being necessarily an informal meal, there is less ceremony than at dinner. Fruit, if used, stands upon the table; as all the family can seldom be present at the same time, other things are kept hot in the kitchen and brought to the guests as they arrive. An English family that entertains with bountiful hospitality, serves breakfast to their guests at any hour of the morning, but in a private family guests should observe the rules of courtesy by adapting themselves to the breakfast hour, as also to all other customs of the family they are visiting, as delays of this kind often make a deal of trouble and extra work.

Nothing is so suitable for a dinner table-cloth and napkins as pure white damask. For breakfast and lunch red damask looks well and washes admirably, but colored embroideries on white, or any elaborate work where changes for washing are so often made, seem altogether unsuitable. Flowers are a pretty adornment for the table, but they should not be profuse. A slender vase at each end of the table with flowers of a single kind, with their leaves, are much prettier than bouquets of mixed colors. A very desirable addition to the table is a small tea-kettle of copper, bronze, or polished brass, with its alcohol lamp, to keep the water at boiling point all through the breakfast or tea. It costs from two to eight dollars. The hot water is used to heat the cups before pouring the tea or coffee, and to regulate its strength.

Many rules for good table manners will occur to all who are observant, and the best way to inform one's self is to watch carefully those who are considered as models of polite behavior, and copy their habits in this respect. ETHEL STONE.

A Table Jardiniere.

The very pretty and novel jardiniere for the table shown in the engraving, is made of six pieces of thin wood neatly glued together, and a board fitted in for the bottom. When made of oak it can be left

A JARDINIERE FOR THE TABLE.

the natural color of the wood or gilded, but if of pine, paint it black or brown. Paint some objects on the sides in colors, which will harmonize with the plants that are to be held. After the flower-pot is placed in, lay moss over the top to conceal it from view. If large brass-headed nails are used for feet, the jardiniere will be finished.

A New Photograph Receiver.

The hanging receiver for photographs seen in the engraving, is made of dark-brown plush, with forget-me-nots embroidered in light blue. First cut out the foundation or back, which should be of heavy paste-board, seven and a half inches wide, and as long as desired. It can be half as long again as the one here illustrated.

The pieces for the outside are seven and a half inches wide, the top cut in squares measuring an inch and a half each way, and long enough to lap over one another. The forget-me-not spray on the top of each piece should be embroidered before it is covered. Baste the plush neatly on the paste-board, and line it with light blue silk or Silesia. When all the flaps are finished in this manner, sew them firmly to the plush-covered back. If the sprays are painted instead of embroidered, it can be done better after it is all finished. Fasten the top to a brass banner-rod, and hang the receiver with a light blue silk cord.

A PHOTOGRAPH RECEIVER.

How to Make Good Pickles.

It is the duty of every housekeeper to make, or see made, the pickles to be used in her family. To this end (if she does not know how), she should learn to make an eatable pickle—one she knows contains nothing injurious. There is a principle in everything; that of canning fruit is to expel the air by means of heat and expansion, and then keep the air out by means of rubber and glass, tin and solder. The principle of pickling is to reduce the fruit or vegetable by means of salt or boiling, and then supply the waste or displacement by vinegar. Experience has taught us, that fruit and vegetables of all kinds will keep perfectly in vinegar, if certain principles are understood and intelligently followed. You must have good, strong vinegar; take whatever trouble is necessary to secure it. Be willing to follow a recipe in which you have confidence. Many fail, because they will not be exact. They guess at the measurements. Being short of sugar, they use less, but having plenty of spice, a double allowance is thrown in. Instead of taking the kettle from the fire at the boiling point, the vinegar is allowed to boil until the strength is quite gone out of it. This inexactness is all wrong.

CUCUMBER PICKLE.—We will suppose you have five hundred small, green cucumbers. Wash them at once, rejecting any that are soft in spots. Place them in a jar, and pour over enough well salted water to cover them. The color is better if the brine is cool, about a pint of salt to a gallon of water is the rule, well dissolved and mixed. Let them stand twenty-four hours, but not longer; better only twelve hours than too long. If bubbles arise on the water it is time to take them out, as the flavor will spoil. Let them drain or wipe them dry. Take as much vinegar as you used of water to cover them. Spice it well with mustard, capsicum, whole ginger, allspice, and a little mace, but use no cloves or cinnamon, as these latter discolor and spoil the flavor to most tastes. To every gallon allow a piece of alum, the size of a hickory nut or a trifle larger. Let the vinegar and spice come to a boil, and pour it over the cucumbers in a

narrow-mouthed crock. Keep in a cellar or a cool room covered with a crock-lid. A little sugar, say a quarter pound, will help to make the pickles keep, and in time it strengthens the vinegar. The mixed spices of the stores are usually good.

MANGOES.—Take young, green, smooth-skinned musk-melons, not larger than three inches in diameter, cut out a piece and remove the seeds; fill in with any small vegetables, and tie on the lid. Place the melons in brine, and afterwards drain and pickle them exactly as for cucumbers, using mustard seed a little more freely, a half teaspoonful in each melon before tying on the lid.

ONION PICKLE.—Use small onions; peel them, and place in brine for twenty-four hours; afterwards drain very dry, and pickle as for cucumbers.

CAULIFLOWER.—The principle is the same; cover with salt water, restore to crispness with spiced vinegar and a trifle of alum.

RED CABBAGE.—Cut in neat, even slices, sprinkle salt on the layers and let stand over night, rinse off the salt, drain dry, and pour over spiced vinegar and cover. Remember a little alum, not too much, is necessary to make it crisp.

HIGDON.—This is an old-fashioned favorite. Mixed vegetables of any desirable kind are cut in fine slices, and treated the same as red cabbage.

GREEN TOMATO PICKLES.—Take green tomatoes, slice evenly and finely with or without sliced onion. To one gallon allow two quarts of vinegar, well spiced with cloves, cinnamon, and ground mustard, with a half pound of sugar added.

PICKLED PEACHES.—We now come to another order of pickle, requiring entirely different treatment. The principle is the same, however, though instead of reducing with salt, heat is used. To seven pounds of peaches allow one quart of vinegar, and three or four pounds of sugar, whole or brown, spiced with cinnamon and cloves, whole, if convenient, if not, the ground will do, though not as good. Bring the vinegar to a boil, adding a few peaches, when reduced a little take out and add more. When done, pour the juice over the whole.

PICKLED PLUMS.—These are made very much the same as peaches, though you may vary, if you wish, by boiling the vinegar three successive days, and pouring over the fruit. Crab apples, cherries, pears, or any tree fruit may be pickled in this way. Remember, that for vegetables use salt, vinegar, alum, and any spice, excepting cloves and cinnamon, and for fruit use a quart of vinegar to three or four pounds of sugar, with cloves and cinnamon as spices to suit the taste.

AUNT HATTIE.

Our Sleeping Rooms.

LUCY RANDOLPH FLEMING.

A physician of note says, "we hear a great talk about malaria now-a-days, but there is more malaria to be found in most modern bedchambers than anywhere else." Persons who are moderately intelligent on other topics, appear to have small thought, or that very perverted, on the subject of hygiene in their sleeping rooms, and especially those occupied by children. The ventilation of a bedchamber cannot be too carefully attended to; and, as says Horace Mann, "seeing the atmosphere is forty miles deep all around the globe, it is a useless piece of economy to breathe it more than once." Yet nine mothers out of ten will carefully close all the windows, "for fear of colds and night air," and leave two or three children to sleep in a stifling atmosphere, and see no connection between the colds and throat troubles they have, and the vitiated air she compels them to breathe night after night. Let the morning air and sunshine into the bedroom as soon as possible after the occupants have risen; and if there is no sunshine, and it is not raining, let in the air. Do not make up beds too soon after they are vacated. You may get your house tidied sooner, but it is neither cleanly nor healthful to snugly pack up bed clothing until the exhalations of the sleepers' bodies have been removed by exposure to the air.

Look carefully after the wash-stand and the vari-

ous utensils belonging thereto. The soap-dishes and tooth-brush mugs cannot be kept too scrupulously clean. All slops and foul water should be emptied very promptly. Wash out and sun all pitchers, glasses, and whatever vessel are used in the sleeping room. Never allow water, or stale bouquets of flowers to stand for days in the spare chamber after the departure of a guest. Towels that have been used should be promptly removed, and no soiled clothing allowed to hang or accumulate about the room. Closets opening into a sleeping apartment are often the receptacles of soiled clothes, shoes, etc., and become fruitful sources of bad air, particularly where there are small children. After such places the housewife should look with a keen eye for objectionable articles, and remove them with an unsparing hand. I have encountered such closets, in which one might find all the odors traditionally belonging to the city of Cologne—any one of which was enough to suggest ideas of disease-germs.

Even so innocent a piece of furniture as the bureau, may by carelessness become the recipient of articles, which may taint the air of your bedchamber. Damp and soiled combs and brushes are not only unsightly and disgusting, but lying soiled and unaired from day to day, will certainly contribute to evil air and odors, as will also greasy and highly scented hair ribbons, etc. Never lay freshly laundered clothes upon the bed; nor air the same in your bedroom, if possible to do so elsewhere. Do not hesitate to light a fire on cool mornings and evenings; and if so fortunate as to have an open fire-place, you possess a grand means of comfort and ventilation in the bedchamber.

A Corner Medicine Cabinet.

The Hanging Cabinet, shown in the engraving, can be made very ornamental. The case is of black walnut with panels of light wood. Wild roses are painted on one panel, and rushes on the other. There are three shelves to hold vials. Below is a drawer for court plaster, pieces of linen, string, etc. A lambrequin of velvet, embroidered and

A MEDICINE CABINET.

edged with fringe, gives a handsome finish to the cabinet, while the top can be used as a shelf for a vase or other ornamental object. The lamp may be there during the day. Much time and suffering may be saved if a medicine cabinet is close at hand, well stocked with standard remedies and such other things, as are important in cases of illness. Label every bottle or package plainly, and keep nothing of a poisonous nature among household remedies.

Shoe-Case and Bag for Soiled Linen.

The articles as seen in the engravings may be of almost any material, cretonne or calico being preferred, as they shed the dust. To make the shoe-case shown in figure 1, take a piece of the

Fig. 1.—A SHOE-CASE.

goods double for the back, twenty-four inches long and seventeen wide. The piece of which the pockets are formed is thirty-three inches long, and ten inches wide, also made double. Stitch two pieces four and a half inches from the outside edge, which make a place for the pasteboard. Cut the pasteboard eight by ten inches, and slip it in place; plait the spaces which are left at each side to fit the back, and baste on the pockets. The flaps are made the width of the back, and seven and a half inches deep. Bind them with braid and baste in place, afterwards bind it all round with braid, and sew pieces on each pocket by which to tie it up. The bag for soiled linen (fig. 2), is made of two straight pieces sewed together all round, stitching it twice across the top. Cut a slit in the front, and bind it with braid. Hang the bag with braid.

Fig. 2.—A CLOTHES BAG.

Have More Salads.—Their Healthfulness.

Probably no people use so few salads as the Americans. Here Lettuce is by a large majority regarded as the one plant to be used as a salad, and this is most frequently dressed with sugar and vinegar. The primary reason why we should use more salads, is their healthfulness. Sailors upon long voyages and soldiers on service on the frontier, subsist largely upon salted meats, and are afflicted with that most distressing disease—scurvy. A supply of fresh vegetables at once effects a cure. The antiscorbutic (against scurvy) action of vegetables is well established, and is supposed to be due to the saline matters they contain. In cooking vegetables, a large share of these saline constituents are removed, which is supposed to account for the fact, that raw vegetables are more effective than cooked in the cure of scurvy. In the early days of California mining, scurvy was a common disease, and the miners gladly paid a dollar a-piece for potatoes, which they sliced in vinegar and ate raw. Farmer's families, especially those who live a long distance from markets, of necessity live largely upon salted meats. This diet produces ineipient scurvy, as is often manifested in defective teeth, bad breath, and a colorless skin, accompanied by an inordinate desire for pickles and acids generally. Have more salads.

Caught in the Battle.

A VIRGINIAN.

"Now, Uncle Edward," said Tom and Bessie Grayland, "the last time you were here we asked you to tell us a story, and you said that you hadn't time then, but would do so when you came to see us again; so put away your paper and tell us a good one."—"So I did," replied their uncle; "and if you will be attentive, I will relate an incident that happened in the first year of the civil war, which you have read about in your school history.

"In the wilds of the southern Alleghanies, there once lived a boy and girl whom I shall now call Will and Nellie. Unlike you two youngsters—who have been to the great cities, where

all farewell, saying it was necessary for him to return immediately. Will and Nellie climbed to the top of the high rail fence, and watched him as he passed up the steep, shady road, until he arrived at a place where it made a quick turn, taking off his cap he waved it several times over his head, and a moment later the dark trees completely hid him from view. Then they got off the fence and began questioning their mother, who seemed greatly worried over something. She told them that a great Union army was marching to take the mountain, and their father had permission to come and direct her what to do in case of danger. The boy and girl must not venture far from home for fear something might happen to them. Will and Nellie did not always heed their mother's advice, and the following morning Will proposed to go to the top of the mountain and see their father. 'I tell you, Nell,' he said, coaxingly, 'you'll see a heap you don't know what it is; you just ought

what to do, they were suddenly startled by a discharge of guns in a distant part of the mountain. 'Oh, the Unions!' they said, and filled with terror they turned, and made a desperate effort to find the road which they meant to follow home, not knowing that each step they took was taking them directly from it. The firing had now become very frequent, and was not confined to any particular part of the mountain, but seemed to be all around; and then began the booming of cannon, which would, for the time, drown the clatter of musketry, and cause the whole mountain to tremble from top to bottom, as with the shock of an earthquake.

"Come on fast, Nell, let's find the road and get home!" said Will.—"Oh, we'll be killed!" cried Nellie, as she hurried along at his side. For a while there seemed to be a pause in the firing, but in a few minutes it was renewed very near, and suddenly there was a rustling noise among the dry leaves, a swaying to and fro of the dense under-

ON THE PICKET LINE AT NIGHT.

Drawn and Engraved for the American Agriculturist.

you walked the streets and saw huge ships—these tow-headed children had never seen anything of the outside world. Their principal amusements were hunting wild flowers on the mountain side, chasing butterflies up and down the lonely road, and fishing for minnows and craw-fish in a little brook that flowed through the orchard. After awhile came the great war, and Will's and Nellie's father was drafted into the Southern service. Away up on the top of a high mountain his regiment was intrenched, and one time he took Will up with him, and the boy had wonderful things to tell Nellie when he got home, about the immense earthworks all bristling with cannon and bayonets. One day they were much surprised to see their father come home. It was nothing unusual for him to visit his family on Sundays, but this day was no Sunday, and why he came was then a mystery. After remaining a short time he bade them

to see all of those cannons and guns.—'But suppose the other soldiers come while we are up there, then what would we do?' inquired Nellie.—'Oh, you needn't be afraid of them,' said Will, 'we'll be back long before they can get here.' Nellie hesitated for a while, but finally Will's glowing description of the things she would see, overcame her disposition to remain at home, and she willingly consented to accompany him. Up, up, up, they went, until the long windings became very tiresome, particularly to Nellie. Will, in order to facilitate the ascent, suggested that it would be much easier to go directly up, instead of following the long, winding road. This they attempted, and walked and walked, and still the top which they every minute hoped to reach, seemed as far off as ever. They reached the top, but alas! it was not the top they sought, only a spur of the mountain. They were lost. While they stood there wondering

growth, and a large number of men in blue clothes and with bright guns swept by. A few of them appeared to see the children, for they looked toward them wonderingly, but of course could not render them any assistance. 'That's the Unions,' said Nellie, crying bitterly, and Will, no longer able to restrain himself, also gave way to tears. Away went the soldiers up the rough mountain side, and Will and Nellie saw some of them fall, as volley after volley was poured among them; and every now and then a big bomb, with its fiery trail, screamed by in its lofty flight over the trees. On, on they wandered, over fallen timber and huge rocks, and through deep ravines, until the day was nearly spent, and still the battle raged, but at a long distance from them. All at once they came upon a wounded soldier. They drew back in horror, but when they saw the poor dying man beckon to them, they summoned all their courage, went

in new positions. On placing one in a mulberry tree, it slowly raised itself to look over the edge of a branch to the ground, elevated its head apparently to examine the height of the tree, then looked behind, before and beside it, still standing in one spot. Ten minutes' examination seemed to satisfy, and then down went its head to eating as fast as though determined to make up for lost time.

"But of what use are such gluttonous boarders?" asks the reader. Well, of what use is your pretty silk scarf and ribbons, or your blue silk dress?

My boarders at length had eaten enough, and went hunting about for places to spin themselves little silken nests. Some of them climbed to the top of a branch and began there to spin; others crawled into round cells made of pasteboard, and two or three were so foolish as to spin from leaf to leaf without apparently knowing how to make a nest at all. But when the latter were shut up in small boxes, they went about their nests, and in three days had them all made and were shut up inside. In the heads of my boarders are two small holes or ducts from which the silk comes out, and afterwards unites, making one thread. The worm moves its head from left to right, and from right to left, until the cocoon is made. It is usually from an inch to an inch and a half in length; not so long as the worm inside, because the latter is curled up. When the cocoon is yellow, it looks like a pea-nut, being depressed in the middle in the same manner as that strange underground fruit.

Were my boarders shut up to die? I waited to see them come out for days and even weeks. "Were they not hungry?" No, they had no more use for mulberry leaves. Early one morning there came out a prisoner with crimped, damp wings, through one end of a cocoon. It was grayish-white in color, with brownish markings across the wings, and very pretty. How different from the three-inch, fat worms that went in! I did not know my boarder now. It would not eat a bit of mulberry. At length other moths came from the cocoons to keep it company, and the next day I found a whole lot of tiny eggs, looking just like those I had received in the little box.

The moths stood around in a long box, walked from side to side of it, and at length died. Can you tell me now the name of my former boarders?

In order to get the material for your silk dress, a great many worms have to die; for, in coming out of the cocoons, the moths break the threads so that the silk cannot be reeled, therefore the chrysalides within must be smothered. The usual way is to place the cocoon in a heated oven or in a basket covered closely with flannel over boiling water for about an hour. We will hope that the prisoners are fast asleep, and know nothing of being steamed to death. MRS. C. E. BAMFORD.

The Doctor's Talks.

There are two "shell-fish," living in salt-water, that are known as clams in some localities. These are: the so-called round, or hard clam, with a thick heavy shell. This is not properly a clam, but a quahog. The true clam, distinguished in some markets as the "soft," or "long clam," is a very different animal. It lives in the sand between high and low water mark, burying itself to the depth of several inches. If you walk along the sand at low tide, you will notice little streams of water spouting up from holes in the sand. This water is discharged from the clams when alarmed. By digging at these places you will soon come upon the clam, which is shown in figure 1, with one of its shells removed. Its shells are quite thin, usually white, and of the shape shown in figure 2, which represents the inside of the shell. Like the fresh-water animal, this has a foot, shown at *f*, figure 1. Between the two shells is a thickened portion of the mantle, *m*, which fishermen call the "rim." Like the fresh-water clam, this has two tubes, one for taking in, and the other for sending out water. These, *s, s*, are inclosed in a strong sheath, which is represented as divided lengthwise, in figure 1. The tubes in the sheath form together what along-shore people call the "snout." The clam can so

elongate it, that it reaches from its resting place, up to the surface of the sand. When the tide covers the sand, the clam takes in water through one of these tubes, which supplies the gills with breath, and at the same time it brings in minute

Fig. 1.—CLAM SHOWING THE ANIMAL.

creatures, upon which the clam feeds. When the rising tide covers the sand, the end of the snout is at the top of the hole, and the water passes in at the larger opening, and out at the other. Around the openings of these tubes there are little feelers, like a fringe, which, by their constant motion, keep a current of water flowing in at one opening and out at the other. This condition of comfort gave rise to the along-shore saying, "As happy as a clam at high water mark." To see the animal itself, one of its shells must be removed as in figure 1. At *m*, in the thick portion of the mantle (see last month's Talks for description of the mantle), *a, a*, show where the two muscles are attached that hold the shells together. The foot is seen at *f*; the gills, *g*, are delicate plates, two on each side of the body, *b*, which they nearly hide. The body is large and globular, and is the principal eatable portion of the clam.

The inside of a clam shell is given in figure 2. In the fresh-water clam, as shown last month, the strong ligament that acts as a hinge and holds the two shells together, is on the outside; here, as

Fig. 2.—A CLAM SHELL.

seen at *l*, it is on the inside of the shells. The marks *aa* and *pl* are scars which show the points where the strong muscles, those which draw the shells together and close them, were attached. The irregular line, *pl*, marks the portion of a shell to which the mantle of the animal was attached.

A Dakota Boy's Letters to his Friend.

FRIEND JAMES:—I have intended to write you ever since we came to Dakota, but have been so busy that it was almost an impossibility. We left the East in a "Prairie Schooner," and enjoyed the trip very much. I will tell you how we fixed our wagon. We had a good ox-team, and father bought a new, strong lumber wagon with a double box. We took some two by four basswood scantling, cut six feet long, using five pieces, and laid them crosswise of the box, cutting notches about an inch deep, where they rested on the box to keep them in place. They projected over each side eighteen inches. Boards were nailed on the underside, outside the box, and a strip about six inches wide on the ends of the scantling. Strips of basswood, one by two inches, four feet long, were fastened upon these six-inch boards with screws, and made a solid frame about four feet high and six feet wide. We covered this on the top and sides with a heavy manilla building paper, all of one piece, for sides and top. The joints came on the strips, to which they were firmly pasted and tacked. A strip of carpet binding was placed over the joints, through which the tacks were driven. Afterwards the whole top was given one coat of a light-colored paint. For the ends we fixed curtains of canvas, so that we could button them on the frame work. They could be rolled up from the bottom or down from the top, just as we wanted them.

Trunks and boxes were packed away in the back end of the wagon box, level with the top of the box, and a straw bed was placed over them. By hanging a curtain up in front, mother and Emma could sleep as comfortable as at home. Father and I would take out the spring seat, and spread some blankets and clothing over strips laid across the front end of the box, and were very comfortable. We brought one horse and a covered buggy with us, and mother and sister would ride in that, father and I driving the oxen. When we stopped for meals, we set up our oil stove on one side of the projecting wagon top, and used the other side for a table, and found it much more comfortable than to get up a fire outside, especially if it rained.

On a rainy day we would hitch the horse and

AN IMPROVED "SCHOONER."

buggy behind the wagon, and mother and sister would ride with us. We brought but little with us besides some crockery, clothing, and a few tools; all other goods were boxed up, and left with Uncle Edward, who will send them to us when we get a place for them.

We came into the territory through Moody County, crossing Lake and Miner counties, then north through Beadle and Spink counties. We found some fine land and had many chances to buy claims which had been proved upon, but father wanted to look further, even if he had to come back, so we struck West through Faulk County. We found some splendid land here, although there is hardly such a thing as a tree in the county, a few being found along the Nixon River. The land is rolling and soil looks very fine. We finally found a quarter section within half a mile of the centre of the country on which a man had squatted and broken about ten acres. He was one who can never be satisfied, so father gave him a little more than the value of the breaking, and entered it as a homestead. He had to go to Huron to file on it, and says that the picture in the December *American Agriculturist*, 1883, is as near correct as possible, and he can almost pick out his picture in the crowd waiting to get into the office building.

Agricultural Fairs as Educators.

D. D. T. MOORE.

During the past forty years, the agricultural and kindred associations, which hold their annual exhibitions, have greatly multiplied in this country. Within that period, a large proportion of the Agricultural and Horticultural Societies, State Boards of Agriculture, and Farmer's Clubs now in operation, have been organized and proved efficient co-workers, in promoting improvement in various branches of productive industry. Several of the Western States and Territories which were but sparsely populated a few years ago, now have many very successful rural organizations, whose annual shows compare favorably with those of New York, Pennsylvania and New England. Indeed, it is claimed that Illinois and Iowa excel any two of the Eastern or Middle States, in the number and efficiency of societies designed to advance progress and improvement in agriculture, mechanics, and the industrial arts and sciences generally. While State Societies and Boards of Agriculture in the West—such as those of Ohio, Michigan, Illinois, Iowa, and Kansas—have accomplished much through their exhibitions, and the dissemination of valuable information in printed form, numerous county and other organizations have sprung up, and proved most efficient auxiliaries in educating and elevating the producing classes. Meantime the intelligent ruralists of the East have made progress in the right direction, for they have sustained and increased the usefulness of old societies and clubs, and organized many new ones which have proved successful, and are now exerting a salutary influence.

The superior fruits, vegetables, grains, seeds, domestic animals, tools, implements and the like, exhibited at the annual fairs all over this great rural Republic for decades past, have proved such object lessons as all could readily understand, and myriads have doubtless thus obtained invaluable points and information about choice varieties of fruit, plants and grains, improved breeds of stock, and new implements and machinery. Observation and comparison at fairs, have taught thousands upon thousands—aye, hundreds of thousands—the better way, and induced them to inaugurate various improvements upon their own premises.

People who attend rural and other industrial fairs with their eyes and ears open—as we apprehend do the intelligent and wide-awake readers of the *American Agriculturist*—cannot fail to see much that is new and useful, and hear more or less that must prove interesting, suggestive, and valuable. A careful examination of the leading departments of almost any industrial exhibition, especially those of agriculture and manufactures, will impart to an observer of even ordinary intelligence, much useful knowledge, and suggest wherein changes might be made in his own operations and management, which would redound to his advantage. But the shrewd, progressive farmer, who is ever on the alert for better plants, animals, implements, and improved modes of culture and management, will be still more benefited, for he will critically examine whatever he sees that is rare or superior—contrasting the exhibits with what he has at home—and learn from successful competitors how they achieved their triumphs. Young farmers, and farmer's sons, can learn much by carefully examining whatever they find that is new and useful at the fairs, and it will pay far better than gazing at the demoralizing side-shows, or other alluring attractions which are still allowed on the grounds of some of our modern exhibitions.

Another important feature connected with some of our prominent fairs, is worthy of notice and commendation. The discussions held, papers read, and addresses delivered at the evening meetings during State and other large exhibitions, often prove very instructive and of lasting benefit to those in attendance—for, as in the proceedings at the annual meetings of Pomological and Agricultural Societies, new discoveries, improved processes, and the like, are made known by practical and scientific experts of rare experience. Thus lessons suggested by objects seen at the fairs, are frequently enforced by the explanation of speakers who are familiar with those objects, and the best manner of their utilization. It is a matter of surprise and regret that these meetings, which may be made very useful and instructive, by developing light on subjects of special interest and importance to producers, are not more generally and largely attended, for they are certainly great educators, and when the proceedings are published, they cannot fail of proving instructive and beneficial to the rural community. Let us have more evening sessions, partaking of the characteristics of Farmers' Congresses or Institutes during the holding of prominent fairs, whereat men of large experience, who know whereof they may affirm, shall discuss subjects of paramount importance to those engaged in the leading branches of husbandry, and our annual exhibitions will become still more popular and beneficial to the many cultivators who attend them.

On the Road.

Hints About Traveling.—It is poor economy to curtail one's comforts on the road. Better economize in other directions, and treat yourself generously while travelling. Do not deprive yourself of a regular meal because, forsooth, it appears to you that an exorbitant price is asked for it. Irregularity in eating, together with the unaccustomed motion of travel, will be very apt to get you out of order physically. Then what would otherwise be a pleasure—that is, sight-seeing and prospecting—becomes tedious; and wearied physically and mentally, you are fortunate if you do not "get down sick" before a long trip is completed. Always take a good night's rest, which cannot be secured in a sitting posture. Be sure and have the porter so make your bed that your head will be in an opposite direction to the one in which the train is going, or, to speak more explicitly—sleep with your feet foremost. Then you are less liable to suffer from the currents of air which creep in through the window-sills, or blow in, if your double windows are open. During warm summer nights, it is generally safe to leave the window open for a short distance, at the foot of your berth. The air thus admitted blows in upon your extremities and purifies the usually oppressive atmosphere in a sleeping car. The Pajama, a night-costume, recently imported into this country from Japan, is a most excellent outfit for night travel. It consists of a loose woolen jacket, or shirt, and loose woolen drawers or pants, both of which can be purchased at dry-goods' stores in large cities, or can be readily made at home after one has seen a pattern. We have found them most comfortable and useful during thousands of miles of travel for two years past, as a protection against cold from without, and from the cold which follows perspiration within, occasioned by a hot atmosphere. Before retiring, always ask the porter to see that the sleeper is well ventilated. At the same time taking care to observe that the admitted air does not blow upon your section. The ventilators at both ends of the sleeping car should be kept open as most conducive to the health and comfort of the sleeping passengers. See to this before retiring.

Sand Flies Extraordinary.—We were not a little surprised, on alighting from the carriage at nine o'clock on a last July evening, at the Leland Hotel, Chicago, located close by the lake-shore, to find the air filled with snow-flakes—so it appeared. It was certainly a phenomenon—a snow storm in mid-summer! The air was filled with these apparent flakes. The porters were sweeping from the sidewalks around the hotel the two or three inches of gathered "snow." The Brush lights were flickering as if about to go wholly out, submerged by the flakes which were rapidly filling the glass globes surrounding them. One light had already been quite "suffocated," and the globe filled to the top. Rifts of "snow" swept into the passage-ways leading to the rotunda, and the verandas along the lake-side of the hotel were fairly flecked from one end to the other with the whitening shower. It was indeed a most astonishing sight with the thermometer at eighty. But a moment, however, sufficed to dispel the illusion. These were not snow-flakes which whitened and covered roof and pavement, and suffocated powerful Brush lights, but sand flies—countless myriads of insects, appearing somewhat like young Dragon-flies, coming up like the locusts of Egypt, from the sands of the lake-shore, to harmlessly fly and flutter for a day and die. The next morning, bushels of them (so the head porter informed us), had been swept up during the night and carried away. They lay dead about the rotunda, through the hallways, in the dining hall, and in guests' chambers whose windows had remained open. Later in the season, we encountered another species at the foot of Lake Ontario, smaller in size, although appearing to have much more vitality. These insects are Day-flies, belonging to the genus *Ephemera*, or closely related to it. Their larval, or grub-state, is passed in the water, and lasts for two years or

longer. After leaving the water they undergo their final change, become perfect insects, and devote their brief existence to providing for other broods. A related insect is found in parts of France in such numbers that they are collected by cart-loads, and used for fertilizing the soil.

The Big Fish Swallow the Little Fish.

—This is pre-eminently an era of centralization. It is rapidly going on in the cattle business, just as in the railroad, telegraph, telephone, and other branches of industry. "We are all apprehensive," said one of the Colorado cattle-growers, "that the big stock companies who are now absorbing all the land and cattle they can get into their possession, may ultimately secure enough political power to enable them to fence in a large proportion of the cattle-grazing regions, and pay the government a large royalty for them." The Land Commissioner of the Union Pacific Railroad, told me at Omaha, last summer, that one of these colossal companies had made a serious bonafide proposition to him to purchase and fence in, the unsold millions of acres of the Corporation's Land Grant adapted for grazing purposes, and extending as far westward as Utah.

The Profits of Cattle Raising.

—Notwithstanding the large stock companies, composed to a large extent of English capitalists, are so aggressive, many of the individual ranchmen continue to hold their own, and to make money. George L. Hopkins, a Brooklyn boy, pleasantly narrated to us, how, going to the Snake River country, Wyoming Territory, six years ago, with two thousand five hundred dollars, and purchasing a small bunch of cattle, they had increased at the rate of eighty per cent a year, with losses of only about five per cent, until now his stock had multiplied beyond the limits of his range. He had just returned from Brooklyn, where he had gone to convey the remains of his partner, who had accidentally shot himself while prospecting for a new and larger range in Arizona Territory.

The Grand Army of the Republic Union at Minneapolis.

—It was a most inspiring sight—the long line of ex-soldiers who filed by in procession, in simple uniforms—officer and private walking side by side, with nothing to mark any distinction of rank, which they may have held during their soldier days. They came from all over Minnesota, from Michigan, Wisconsin, Illinois, Ohio, from far Dakota in the West, and from New York and other Middle States. And what particularly impressed us was the fact, that the great majority of these men, who once carried the musket, are now farmers—yeomanry—brave men, who after the conflict of civil strife, settled down to the peaceful pursuits of agriculture. And there were Confederates among them, too—ex-soldiers of the Gray, now guests of the ex-soldiers of the Blue. A prominent ex-Confederate officer, after the memorable procession, addressed the vast throng from the same platform as the Union generals; and the eloquence of the beautiful oration was only equaled by the expressions of peace and good-will, which marked every utterance. The incident vividly recalled to us one July afternoon in the stormy war period of 1862. Confederate cannon thundering from Loudon, Maryland, and Bolivar Heights formed an almost unbroken circle of fire, which had compelled the surrender of fourteen thousand Union soldiers at Harper's Ferry. This was at eight o'clock in the morning. Before two o'clock on that afternoon, the Northern and the Southern boys were fraternizing all over the village, on the plains of Bolivar, and along the roads leading up the valley toward Winchester. Here was a group sitting cross-legged, and narrating their adventures. There was another group exchanging tobacco. A little party composed of the Blue and Gray were together inspecting the old engine-house, where John Brown made his stand. Still another group were gathering blackberries along the Loudon River. At nightfall the Union prisoners were mostly paroled and sent through the Union lines, inasmuch as Stonewall Jackson desired every one of his own soldiers to join General Lee at Bloody Antietam. All day long the boys had talked and laughed together, and we generally agreed that if things were left to us, we could settle the war then and there. And one of the pleasant incidents of this union—for it was nothing else, brought about by the force of circumstances—was the general disposition of the soldiers, on each side, to exchange as friendly souvenirs their canteens before they parted—the Union soldiers to go to their parole-camps, and the Confederate soldiers to engage in fresh battle. It was roughly computed that nearly ten thousand canteens were exchanged that day.

Plenty of School Privileges.

—Do not be deterred from moving to the rich prairies on the frontier for fear that your children will not enjoy opportunities for education. All over Dakota, the big, magnificent school-house dots the prairie wherever there is a cluster of dwellings. As a general thing, up goes a school building before a church is erected, and the absent

speculator is very fortunate if his lands be not heavily taxed for the construction of these school buildings. In fact, the actual settlers regard the lands of the absent owners as legitimate game in this matter of school taxation. It is frequently the case, that the lands of these absent owners are made to pay all—or nearly all—the school taxes for the entire district. "If these speculators," the settlers often argue, "are to receive the benefits of our improvements in the rapid advance in value and selling price of their own unimproved lands, it is only fair and just, that these lands should pay all the taxes we can put on them by hook or by crook."

Emigration to Oregon and Washington Territory.—During the past spring there has been considerable emigration (following the line of the Northern Pacific R. R.), to Eastern Oregon and Washington Territory. Oregon now has a population of two hundred thousand souls. We are assured that there are de-

Chat with Readers.

Mulberry Trees.—J. McCrone, Trumbull Co., Ohio.—The trees may be set out in the fall or spring. In either case, the trees should have a year in which to get established, before the leaves are gathered for feeding silkworms.

Gooseberries.—C. E. Alton, Jackson Co., Ill., has gooseberry bushes which bloom, but the fruit drops before it is ripe. If the bushes are of foreign sorts, they rarely succeed. If native varieties, try severe pruning.

A Weed from Arkansas.—W. G. Wood, Little Rock, Ark., sends us a specimen of a plant which he says, "is 'taking' this whole country—woods, farms, hills, bottoms, and prairies. Cattle eat it with avidity. This specimen is from a house-yard, or lawn, with a clayey soil, and enriched only by chance droppings of manure."—This plant is the Branched Knotgrass, *Polygonum ramosissimum*, more common westward than elsewhere. It is closely related to the Knotgrass, or Door-weed (*P. aviculare*), so common everywhere,

with the probabilities in favor of a successful result. Try this grass and report to us upon it.

Needle Grass.—"The Stickin."—W. D. Hayes, Lancaster Co., Neb., sends us specimens of the seeds of the grass, known by the name here given, which is also called "Porcupine grass." The grass, *Stipa spartea*, grows two to four feet high. The seed, consisting of the grain inclosed in a tough chaff, is about the size of an oat. At its lower end it has a hard, sharp point, and at the other end is a strong, stiff, wiry, twisted awn, or bristle, from three to seven inches long. According to Mr. Hayes, the grains when they drop soon work out of sight, except the tail. Others have complained of the injury which these sharp-pointed grains inflict upon sheep. Mr. Hayes writes, that the men often come in complaining of "the stickin" which works through the clothing into the skin.

Posts for the Vineyard.—W. Rieding, Ottawa Co., Ohio.—The posts which come from Michigan as White Cedar, are no doubt Arbor Vitæ, that tree being known as White Cedar all through that portion of the West. The mature wood of the tree is very durable. Red Cedar, Black Locust, Osage Orange, Post Oak, and Mulberry make the most durable posts. Probably the most ready way to increase the durability of posts, is, to char moderately the portion which goes into the ground, and then dip it in boiling coal tar. Small stakes, soaked in a saturated solution of Blue Vitriol (Sulphate of Copper), dried, and then soaked for a few hours in lime water, are made durable, but we have not tried it upon posts. Soaking seasoned posts in crude petroleum would no doubt help to preserve them.

Artificial Stone.—G. R. Brobeck, Grayson Co., Texas.—So late in the season as this, it will not be safe to attempt making artificial stone with any but the very best hydraulic cement. The best no doubt is the imported "Roman" cement. This will set at once, and become hard and impervious to water, so that the frost will not crumble it. In the spring American cements may be used, mixed with more or less lime, according to their quality, and that of the lime. The Roman cement is mixed in small quantities, very thin, and intimately mingled at once with fine, sharp sand. This mortar, while still liquid, is mixed with coarser sand and clean and sharp gravel, and is placed in the mould, larger stones being laid in at the same time, and the whole tamped, jarred, and leveled, before it has time to set. The moulds must be made tight, well battened, and clamped, to prevent warping, and so as to be easily taken apart.

Ripening Pears.—H. Lloyd, Chester Co., Pa.—The Duchesse d'Angouleme is a mid-autumn variety, and should be gathered while still hard, before it shows any signs of ripening, and be kept in close barrels or boxes in a uniform low temperature. When the pears change color and become soft, they are in condition to be eaten. An excellent method with small quantities of these and other pears of the season, is to place them in a single layer upon a blanket, and cover them with another in a cool place. The Vicar of Winkfield, though usually regarded as a cooking pear, may, by proper treatment, be made a very acceptable dessert fruit. Let the pears hang until danger of frost; gather and pack in tight boxes or barrels, and on the approach of cold weather take them to a dry cellar. Look to the fruit in December and January, and if some specimens are ripening, remove the fruit to a warm room, where it will soon come into eating condition.

Cranberry Culture.—Adam Fisher, Hardy Co., West Va., and others, have asked us to give information on the subject of cranberry culture. The culture of the cranberry is, from beginning to end, peculiar. It can only be successfully undertaken in certain localities, and every step is quite unlike those in the cultivation of any other fruit crop. Useful information could only be given in the *American Agriculturist* in a series of articles, and these would not be in a convenient form for frequent reference. In view of the difficulty of treating such special cultures in a useful manner in the paper, we have published in the pamphlet form, treatises upon Onions, Tobacco, Hops and others. The culture of fruits is treated in several bound volumes, among which is "Cranberry Culture," by Joseph J. White, a volume of 126 pages, and one of the most complete special treatises, of which we have any knowledge. From the selection of the location, to marketing or using the fruit, it is full on every point. One who undertakes to grow cranberries, especially if a novice, needs a guide like this, to which he can frequently refer in order to meet each of the many obstacles that may occur from time to time.

Legal Protection for Orchards, Etc.—V. Newmark, Solano Co., Cal., asks us: Has the owner of an orchard, vineyard, or melon patch any rights, which the public in general or the small boy in particular are bound to respect?—At the old common law the taking of anything which is attached to the soil, like apples or grapes, was not a larceny. That offence, which is the wrongful taking and carrying away the personal property of another, was not held to embrace the taking of real property. But now both in England and in this country statutes have been enacted, enlarging the common law doctrine so as to meet the requirements of a more advanced age; and in most of the States there are provisions for the very case inquired about by Mr. Newmark. For example in Michigan, a clause of the statutes reads as follows: "Every person who shall wilfully commit any trespass by entering upon the garden, orchard, or other improved land of another without the permission of the owner thereof, and with intent to cut, take, and carry away, destroy or injure the trees, grain, grass, hay, fruit, or vegetables there growing or being, shall be punished by imprisonment in the county jail not more than thirty days, or by fine not exceeding twenty dollars." It is fair to presume that there is a similar provision in the statutes of California.

"PRAIRIE MORASS AND MOUNTAIN."

sirable Government lands to be obtained in the counties of Crook, Wasco, Umatilla, and Lake, any one of which counties is larger than the State of Rhode Island. In Lyons and adjoining counties, improved farms can be purchased at from twenty-five to fifty dollars per acre. Small fruits and orchard fruits of all kinds succeed well in Oregon. As a general thing, the population already on the ground, is very desirable, composed of people of pluck and energy, who have dared to breast the storms and adversities of frontier life. This State of over sixty thousand square miles, is rapidly growing, and promises to eventually become one of the greatest in the galaxy.

A New Industry in Oregon.—Hop Culture is receiving much attention among the farmers of Oregon. For the last three or four years, the hop crop has been very large, and promises to become a leading industry in this State, where an equable climate, together with freedom from insects and diseases, invites its development. The summers are not too hot, and the rain-fall is not too large; so that judging from the experience of the past four years, the crops will ripen to perfection. Our Oregon friends should recollect, that the extent of hop culture will depend upon the number of pickers obtainable, and if they plant too largely in a sparsely settled district, a share of the crop may have to go unpicked.

Rapid Growth.—One November day we rode out to the terminus of a railroad extending from St. Paul to Manitoba. Here was a saw-mill, a few rude structures along the banks of a stream, and a Justice of the Peace holding court in a tent. A broad plateau stretched out on either side, and from all appearances here would be a capital site for a village. I suppose we had enough funds along with us to purchase the entire site. Now, after less than seven years, the city of Crookston with many thousand souls is to be seen here, and all is bustle and activity. We shall next month describe the astonishing growth of places which we visited in Dakota during this trip through the Great Northwest. D. W. J.

which is not an aggressive weed. Being an annual, it should not be difficult to exterminate it with hoed crops.

Leather Scraps and Saw-dust.—W. T. Piper, Suffolk Co., Mass.—Saw-dust is useful as an absorbent in stables, but of little or no value in itself. Leather trimmings, besides being of use as an absorbent, add to the fertilizing qualities of the manure by their slow decay. We should pay the cost of carrying the leather-dust rather than take the saw-dust free of charge.

A Silo Question.—F. W. Evans, Columbia Co., N. Y., writes, that their silos are thirty-seven feet, and the pressure is so great, that it causes the juice to exude from the corn fodder, and collect to the depth of several inches. He asks, how it would answer to cut up old hay and use it to absorb the liquid. We think that either old hay or straw may be cut up and used in this manner with excellent effect.

Pyrethrum for Ants.—Mrs. Wallo Piper, Plymouth Co., Mass., writes us that she finds the "Persian Insect Powder" very effective in destroying red ants. Sprinkle the powder on the shelves where lard, sugar, cake, milk, etc., are kept, even on the sill of the open window, and the ants will disappear as by magic. It looks slovenly to see the powder scattered over the shelves, but it is much preferred to the ants, either red or black.

Unfruitful Orchard.—J. H. Kellogg, Rensselaer Co., N. Y., has a young orchard lying near a pond, which three years ago gave a heavy crop, and since has borne very little. —The lack of fruit may be due to one of two causes. The trees may not have had time to recover from the effects of over-bearing, or the orchard may be so near the pond that the soil is too wet. In the first case, good cultivation will bring matters right in time; in the other it is a question of drainage.

A Grass from Oregon. is sent by F. Hargreaves, Douglas Co., Oregon, who asks us to give its name and say if it would make a good pasture grass.—The specimen is *Agrostis exarata*, a species very abundant on the Pacific, varying from three inches to as many feet in height, according to the soil. It has much the appearance of the Florin, or White Bent-grass of Europe and the Atlantic States. The value of the grass in cultivation is just one of those points which those on the ground should determine. Mr. Hargreaves can do the farmers of his and the adjoining States a good service by experimenting in this direction,

High Priced Butter.

Dairymen often wonder how their more favored competitors get such high prices for their butter the year round. It is by always having a uniform gilt-edged article. To put the "gilt edge" on, when the pastures do not do it, they use Wells, Richardson & Co's. Improved Butter Color. Every butter maker can do the same. Sold everywhere and warranted as harmless as salt, and perfect in operation.

HAYSEED,

OR

How to Develop the Speed in Trotter or Pacer, and Steer Him in a Race.

This book is written by an author every way competent to handle the subject, and combines the experience of both old-time and modern trainers and drivers, and respecting the development of pacers, manner of shoeing, driving, and handling generally, nothing has been written until now. The Rules of the National Trotting Association, as amended by that body at their last meeting; also, the complete list of all horses which have trotted or paced a heat in 2:30 or better, with the pedigrees so far as known, is combined in this work. No owner of road or race-horses should be without this book. Remember that horses must have the opportunity in order to distinguish themselves. Enclose postal notes, currency or silver, at our risk.

PRICE, 50 CENTS.

Sent post-paid, to any address, on receipt of price. Address HAYSEED COMPANY, Toledo, Ohio.

50 Chromo Cards, no 2 alike, with name, and six Latest Songs, 10 cents. J. S. PARDEE, 411 7th ave., N. Y.

TRADE MARK.

FOR INFANTS & INVALIDS

FOOD

THE only perfect substitute for Mother's Milk. The most nourishing diet for infants and nursing mothers. Keeps in all climates. Commended by Physicians. Sold everywhere. Send for our Book on the Care and Feeding of Infants. Sent free. DOLIBER, GOODALE & CO., Boston, Mass.

Our Work Appreciated.

A President of a western college, in making inquiries concerning a suspicious enterprise, writes us: "You are death on bugs—especially humbugs. The attention you give to these last, prevents many thousands of dollars from passing annually to the pockets of knaves from the pockets of fools." If our correspondent had substituted millions for thousands, he would have been nearer right. It is not fair to consider that all who are caught by swindling schemes are fools. The bait often so skillfully conceals the hook, that many honest and well-meaning persons do not suspect fraud until they are caught. It is persons of this kind that we have worked, and shall continue to work, to protect and warn.

A New Turn to an Old Tune.

It is not now a "retired physician whose sands of life are fast running out," or a "returned missionary," nor even some one who was captive among the Indians, but plain "Dr. H. James," who "was experimenting with the many herbs of Calcutta," when he "accidentally made a preparation which cured his only child of consumption." That is the new part. The old part is, "The doctor now gives this recipe free, only asking two two-cent stamps to pay expenses." The chap lives in Philadelphia. If any one wishes to know more about this accidental remedy, he can send for the recipe, and will no doubt receive, after the good old style, one directing the "Calcutta herbs," in names which are meaningless jargon.

A Postal Card Album Competitor.

Those of our readers who saw some months ago in various papers a request from a retired editor and ex-publisher for Postal Card Autographs to gather into an Album, will appreciate the following:

EDITOR OF AMERICAN AGRICULTURIST,
751 Broadway, New York City.

I would like to have the Postal Autographs of all the subscribers of the *American Agriculturist*.

ELLA M——, Guyadotte, Cabell Co., West Va.
August 21st, 1884.

We do not give the full address, as it might be used for the same purpose that Postal Card Autographs are wanted. What that purpose is, this lady evidently sees, and in her neat way speaks volumes of satire in a few words.

The ways of Pension Claim Agents.

L. W. Allen, Hillsborough County, Fla., asks: "Is this fair?" A firm of claim agents in Washington, D. C., had agreed to undertake his pension claim, for which he paid the lawful fee of ten dollars. Mr. A. has recently received notice that Congress passed a law in July last, allowing attorneys the sum of twenty-five dollars, and the agents wished him to pay the increased fee. Hence his question, "Is this fair?" Of course Congress would not pass a law to affect contracts already made. If the agents do not wish to abide by their former contract, it would be "fair" for them to return the papers and the money paid in advance. They can certainly have no legal claim for more. Pension agents, so far as we have known them, will take all that they can get. The notice, while it implies that the law warrants the added charge upon an old contract, does not directly assert it. We would advise you to consult the Member of Congress for your district. Perhaps he may inform the agents as to the legal aspects of the case.

Not a Part of The "Fool Crop."

An inventor of Hydraulic Machines thinking, as he says, we might wish its aid in "investigating this year's Fool Crop," sends us a circular he received from a "Mining and Smelting Company," its headquarters being—of course—in Cincinnati. The circular states that the Directors of the Company have agreed "to adopt the latest improvements in mining machines and imple-

ments, for the purpose of developing to the greatest advantage their several valuable mines" in Colorado. Hence they call upon owners of patents for models or drawings and specifications of their improvements. This company "offer a premium of five hundred dollars cash for each patent which is adapted for use on its properties." It will also "donate to each competitor twenty-five shares, value ten dollars per share."

NOT SO LIBERAL AS IT LOOKS.

The liberality of this offer is less apparent when we read its conditions. Each competitor is charged an entry fee of fifteen dollars, which is to be "forwarded at the same time as the models, drawings, etc.," and these, of course, "must be prepaid." It is hardly necessary to add that our correspondent having sense enough to perfect an invention, was too prudent to purchase fifteen dollars worth of information as to the ways of this enterprising Cincinnati Company.

Neither Prize nor Paper.

"O. V. W.," a P. M. in Benton Co., Ark., writes us, that he subscribed for the "Sunny South," published in Brown Co., Texas. He was informed that he was entitled to something from a "grand drawing," and he sent the necessary directions for shipping, etc. Nothing came, and he has "written to them time and again, telling what number it was, etc., but to no avail." Moreover Mr. W.'s wife also subscribed to the same paper; she was sent a similar certificate to sign, but no prize came, and not a single copy of the paper.

PAPERS WITH LOTTERY ATTACHMENT SUSPICIOUS.

Any publisher who proposes to aid his circulation by means of a lottery—no matter if he calls it a grand distribution, starts with the intention of violating the laws of the United States, and generally of his own State. Experience has shown, that there is no difficulty in the way of sending money to such papers, but when prizes are to be drawn, or if they are alleged to be drawn, it is found out that the post office laws and rulings prevent their transmission to the subscribers. All who are tempted to subscribe to a paper, no matter where it may be published, that proposes by "distributions," "drawings," "gift enterprises," etc., to distribute prizes or premiums by chance, should recollect that they aid in an open violation of the laws of the United States.

That Toll-gate Open Again.

Advertisements, offering to send to applicants a puzzle picture "The Toll-gate," appeared at one time, several years ago, in nearly every paper. This "picture" was a card about the size of an ordinary envelope, with a very coarse attempt at a puzzle on one side, and on the other the advertisement of a book by a quack Doctor, a catalogue of the contents of which decency prevents us from publishing. Having heard nothing of late of this book and the peculiar method of bringing it to the notice, especially of young people, we supposed that like so many things of the kind, it had died out. It seems that this gate to nastiness was only temporarily closed. The "Toll-gate" is out in a new form, called the "Shool Fly!" edition. It is a picture almost as coarse as the former one, and has an enormous insect in the centre, indicating what may be seen by turning over the card. Humbug! Besides the advertisement of the book; there is also one of "Dr. Abbey's Great Specific for Skin Diseases." One who claims to have a "Specific," has no right to the title "Doctor."

PLEASE DO WHAT YOU CAN.

A subscriber in Dutchess County, N. Y., and no doubt a parent, writes us very much in earnest about the toll-gate, and asks us to do what we "can to prevent its transmission through the mails."

Petroleum vs. Stock-Gambling.

Most of our readers will recollect the great facilities that were offered to people everywhere to engage in the pleasures and excitements—and also the risks of Wall Street—by parties assuming the names of responsible brokers. This scheme was broken up by the arrest of the principal parties and shown to be a very hollow cheat. "Stock-gambling made easy," is no longer allowed, but people at a distance are provided with a means of easily getting rid of their money in speculations of another kind.

PETROLEUM.

Our subscribers in Michigan and other Western States are favored with circulars headed "Petroleum," which they are told is "fast becoming the favorite article for speculation." The circulars have the true ring, as they, of course, warn those who receive them that it is "dangerous and unprofitable in the hands of cunning manipulators." We are told that "with fifty (\$50) dollars one

can buy or sell one thousand barrels of Petroleum, although one hundred (100) dollars is a safer margin." Safer—of course much safer for the broker—when he gets it. This recent dodge to make money by pretending to induct farmers and others into the Mysteries of Wall Street is not likely to be enormously successful if we may judge by the way it is regarded by one in Michigan, who writes on the circular he sends us: "Thought this needed airing a little in your humbug columns."

1885

BEGINS NOW.

All **New** Subscribers for 1885, whose subscriptions come to hand before **October 31**, will receive the *American Agriculturist* for November and December of this year without extra charge.

The above applies to **All** new subscribers, from whatever source received—including Premium Clubs.

Those too distant to receive this number before **October 31**, will be allowed 10 days after its reception in due course of mail, to take advantage of the above in presenting the paper to their friends.

Agents, Attention!
Boys & Girls, Attention!
Clerks, Attention!
Ladies, Attention!
Clergymen, Attention!
Conductors, Attention!
Churches, Attention!
P.O. Clerks, Attention!
Merchants, Attention!
Miners, Attention!
Farmers' Clubs, Attention!
Everybody, Attention!

Do not fail to carefully read the Supplement of this October number, and see how easy it is to secure one or more of the large number of valuable and useful articles which are there described. Something will be found for every taste, or suitable for a gift to any friend. Will you have one or more of these good Premiums? A little effort secures them. **Try it.**

Enlarging our Borders.

As the prosperous farmer from time to time adds to his acres and enlarges his domain, so the *American Agriculturist* has annexed country after country until it has girdled the globe, and has its readers in the most distant lands and the "isles of the sea." Its subscription books show long lists from every country where there are English-speaking cultivators of the soil. The lists of subscribers at some post offices in Australia and Tasmania are as large as they are at some of our home post offices in towns of similar population. English colonists everywhere find the *American Agriculturist* better suited to their circumstances and needs than are the agricultural papers published in their mother country. The number of subscribers in South America is large, and we are often solicited to issue an edition in the Spanish language.

An Erroneous Report.

In forwarding us a basket of fruit a New Jersey subscriber asks if Orange Judd is dead. This inquiry frequently made is doubtless due to a current rumor of his death, when he failed last year. In 1864, after returning from the army hospitals, Mr. Judd was afflicted with a severe attack of "malarial complaint." Indeed the September *Agriculturist* of that year said: "his health continued to fail and all the usual remedies and the skill of physicians seemed to avail nothing." Though he was subsequently relieved by "a decoction of blackberry root, beef tea, and cream," he has ever since complained of ill-health, with frequent sunstrokes. Indeed, indications of failing health appeared to increase as he approached the allotted threescore years and ten. Six years ago, the present managers were called to take charge of the business of the Company, Orange Judd having relinquished the Editorial management many years before. After his failure last year, the Company sent him up to their farm in Orange Co., N. Y., where it was hoped that the quieting influences of country life would bring mental and physical restoration. The physician there, however, Orange Judd stated, certified that he was still liable to sunstroke, and should keep aloof from his fellow men—which may in a measure account for these inquiries as to his decease.

Profitable Employment.

Persons having leisure time on their hands, or wishing profitable employment, should canvass for subscriptions to this journal. Special inducements presented on application to us. Many make very remunerative wages by securing the premiums we give for subscribers, and disposing of them for cash. One lady in particular has realized several hundred dollars monthly in this manner during the autumn and winter months.

The Publishers and Editors will be excused if they indulge in a little self congratulation over the great variety of matter, general artistic appearance and generous advertising patronage of this October number of the *American Agriculturist*. It significantly demonstrates that treachery and trickery are no more successful now than over-reaching and systematic rascality have been in the past.

Our * Great * Special * Present.

It is not Appleton's Cyclopædia, Price, - - \$80.00
 It is not Johnson's Cyclopædia, Price, - - \$42.00
 It is not Chambers' Cyclopædia, Price, - - \$25.00
 It is not the Encyclopædia Britannica, Price, - \$125.00

—♦♦♦ BUT THE ♦♦♦—

AMERICAN AGRICULTURIST FAMILY CYCLOPÆDIA.

With over 700 Pages, 1,000 Engravings, and a copious Supplement by the Editor-in-chief of this paper for nearly a quarter of a century, which is PRESENTED to every Subscriber, at \$1.50, (old and new), to the *American Agriculturist* for 1885. More convenient for every-day practical purposes, than any one of the above expensive works. For full particulars see page 452, Premium List.

Beautiful Birthday Presents.

Our superb Premium List presents many beautiful and appropriate articles for birthday gifts. There is a variety to suit every taste; and there is no more pleasing custom than this annual presentation of birthday souvenirs to one's kindred and friends.

Remember Your Pastor.

There are many articles in our Premium List this year, which make most appropriate gifts for your pastor; and a very little effort on the part of a few members of the congregation will secure one or more of these presents for your minister, for his wife, and for his family.

Two Engravings to Every Page.

Nearly one hundred engravings are employed in each issue of the *American Agriculturist* to enforce and make clear the thoughts of the many writers. When the monthly issues for a year are bound together, every subscriber has a large volume of more than five hundred pages, and over a thousand instructive engravings—or more than two pictures to each page.

Our Great Offer.

Our present subscribers will please show to their friends and neighbors page 452 of the Supplement, describing the New Family Cyclopædia, which every one of them can have who subscribes before December 1st, and pays the regular subscription price of \$1.50 per year, and fifteen cents extra for packing and postage, making \$1.65 in all.

The Forty-fourth Year.

The *American Agriculturist*, after long years of successful growth, will soon begin its forty-fourth year like a strong man ready to run a race. More thoroughly equipped than ever before, it will be the aim of the Publishers to make each succeeding issue surpass the preceding in all its valuable features. We are in daily receipt of letters filled with wonder at the marvelous success of the *American Agriculturist*. They cannot see how so much can be furnished for so little. This surprise will be still greater in the years to come.

We have to thank friends for forwarding us still another printed circular in the line of the Postal Card Album business, aiming at both the circulation and standing of this Journal. Further letters of the same character, marked "Private," have likewise been forwarded to us by the receivers, who are too honorable men to countenance tricky and underhanded operations.

We renew our request that Editors, Club-Raisers, Canvassers, and Subscribers, will oblige us by continuing to forward documents and letters, indicating that any subscription lists, or lists of club-raisers belonging to this Establishment, may have been treacherously and surreptitiously made. The Postal Album scheme has been pretty thoroughly ventilated all over the country, and we shall thank all our friends to aid us in exposing each similar fresh scheme for either securing the subscribers of this journal or impairing the good will of this Company. The very fact that letters are marked "Private," should not, when the purpose is so clearly transparent, deter the receiver from forwarding them to us if they are kindly disposed to do so.

TERMS TO CANVASSERS AND CLUB RAISERS FURNISHED ON APPLICATION.

Valuable Books Presented

Every subscriber who sends us a new subscription for 1885, before Nov. 1st, and ten cents extra for postage on the book, making \$1.60 in all, can order from us free and post-paid any one of the three following useful works:

FARM CONVENIENCES.

A PRACTICAL HAND-BOOK FOR THE FARM.

Published, February 20, 1884.

Over Two Hundred Illustrations describing all manner of Home-made Aids to Farm Work. None of these Contrivances are patented, and all farmers can readily make most of them for themselves.

A Manual of what to do and how to do it. Made up of the best ideas from the experience of a large number of practical men. Every one of the two hundred and forty pages and two hundred engravings, teaches a lesson in itself in Farm Economy.

This invaluable book contains simple and clear descriptions of labor-saving devices, for all departments of Farm Work. It abounds in important hints and suggestions, to aid farmers in the construction of these labor-saving devices. The volume is, so to speak, a complete hand-book for doing every-day work quickly and readily. Among the many subjects treated are:

Bins for Oats,	Management of Young
Movable Hen's Nests,	Bulls,
Hints for the Work-shop.	Boat Building,
Business Habits,	Hay Raeks,
Relief of Spavin,	Manure,
Tool Boxes,	Making Hinges,
Watering Places for	Shaving Horses,
Stock,	Ventilating Fodder
Doors,	Stacks,
Harrows,	Clearing Lands,
Feed Raeks for Sheep,	Troughs,
Stalls,	Hog Killing,
Cements,	Improved Dump Carts,
Prevent Washing of Hill-	Stone Boats,
Sides.	Fall Fallowing,
Unloading corn,	Ringing and Handling
Lime and Lime Kilns,	Bulls,
Mixing Cement,	Raeks for Sheep.
Fastenings for Cows.	

Price, Post-Paid, \$1.50.

HOUSEHOLD CONVENIENCES

Fully Illustrated with Over Two Hundred Engravings.

Published, February 20, 1884.

Every House-keeper can save many times the cost of the work, by providing herself with a long list of cheap, easily constructed labor-saving devices. The secret of success in house-keeping is knowing how to do things quickly and well. "Household Conveniences" is a key to this secret.

A Most Complete Volume, filled with Valuable Hints and Suggestions, for doing all kinds of Work in the Household.

None of these Contrivances are Patented, and all Housekeepers can readily make them for themselves.

CHAPTER I.—ABOUT THE HOUSE.

CHAPTER II.—THE CELLAR.

The Cellar in General, Musty Cellars, Ventilating a Cellar, Ice Boxes or Refrigerators, Preserving Ice, Meat Safes, Water Filterers, Milk Cupboards, Cheese-Presses, Butter Stamps, Cellar Windows, Coal Bins, &c., &c.

CHAPTER III.—THE KITCHEN.

Flour-Boxes, Spice-Boxes, Folding Ironing-Tables, Side-Tables, Bread or Kneading-Boards, Baking-Tables, Wash-Benches, Wash-Sinks, Graters and Slicers, Clothes-Driers, Summer-Drinks, Cooling-Frames, Coffee-Mills, Neat Wood-Boxes, &c.

CHAPTER IV.—PANTRIES AND CUPBOARDS.

Chimney and Corner Cupboards, Well Arranged Pantries, Poison Boxes, Store-Room Boxes, &c., &c.

CHAPTER V.—THE DINING ROOM.

Cases for Silver, Convenient Side-Tables, Table Decoration, Inexpensive Decoration Generally, Extension Leaf for a Common Table, How to Carve, Fruit Cans.

CHAPTER VI.—THE SITTING ROOM.

Plant Shelves, Rustic Window Boxes, Picture Frame, Vines in Window, Decorative Art, Flower Boxes, Hanging Baskets, Care of Carpets, Carpet Sweeping, Hat Raeks, Stove Pipes, Lamp Shades, Canary Birds, Ornamental Wood Boxes, Paper Holders, &c., &c.

There are other Chapters on the Library, the Sewing Room, &c., &c.—all making the most exhaustive work of the kind extant. The Volume abounds in common sense hints and suggestions from scores of experienced house-keepers, is within the reach of all, and should be a daily consulted work in every home.

Price, Post-paid, \$1.50.

THE NEW AMERICAN Dictionary.

A Most Valuable Volume.

A Concentrated collection of most useful information, including a **Pronouncing DICTIONARY**, of upwards of **50,000 WORDS**, with their Definitions and accurate Pronunciation, a Beautifully Bound Volume, of **600 PAGES—1,000 ENGRAVINGS.**

Fully as good for all practical every-day purposes, as Webster's Unabridged Dictionary.

See what it contains:

1st.—The Dictionary itself, given in **300** pages (3 columns in each page), supplies all the ordinary wants of a Family or Personal Dictionary, and is fully worth the price of the whole book.

2nd.—The next three hundred pages embrace **Forty-five pages of Engravings, illustrating a great number of Animals, Birds, Fishes, Plants, Implements, etc. Over one thousand in all.**

It likewise embraces, among others, the following very useful and valuable facts:

AUTOGRAPHS of all Presidents of the United States.
Explanation of all the 34 words used in the METRIC SYSTEM, now coming into general use in this country, such as *Metre, Centimetre, Litre, Hectare*, etc.
Alphabetical List of American Geographical Names, with their Pronunciation, Derivation, and Meaning.
Popular Names of States and Cities, as "Buckeye State," "Hawkeye State," "Keystone State," "Hoosier State," "Monument City," etc., and why so called.
How to Pronounce Difficult Words. (30 pages.)
Many Valuable Suggestions on How to Speak with Elegance and Ease. (24 pages.)
List of a great number of Slang and Vulgar Words and Phrases to be avoided. (24 pages.)
The History of the United States Flag.
The Area and Population of each of the United States and Territories at each Census from 1790 to 1880.
United States Public Lands — the Amount in each State and Territory; where situated; places of all the Public Land Offices, etc.
Public Land System of the United States.
About Free Homesteads on the Public Lands.
Each year's Prices, for 53 years, of Wheat, Flour, Corn, Cotton, Beef, Hams, Butter, Sugar, Coffee, Bar and Pig Iron, and Coal.
History of American Petroleum.
Tables for reckoning Interest at 4, 5, 6, 7, 8, and 10 per cent, from one day to one year, from \$1 to \$1,000.

Price, Post-paid, \$1.00.

To Bring up a Wornout Sandy Soil.—Use green crops plowed in. When you can turn under a good crop of clover in July or August, before sowing wheat, your land is made. Lime harrowed in after turning the clover under, is always beneficial.

Fall Plowing for Corn?—On heavy clay soils—Yes. Light or sandy soils—No. Soils likely to "wash" by winter rains—No. It is usually best to manure, plow, harrow, roll, mark, and plant, if possible at once. With a manure spreader and teams enough, all goes on well at the same time.

Bladder Plums.—S. T. Nichols, Hartford Co., Conn., writes us, that he had a tree, the fruit of which was blasted and bladdery, and that the application of half a bushel of coal ashes caused it to produce healthy plums. The cure was probably due to some other cause, as coal ashes are almost inert. An absence of the fungus that causes the trouble, allowed the plums to mature.

Sending Fruits.—Many specimens of fruit sent us for inspection are perfectly useless when they arrive at our office table. Place any fruit in a stout and clean box—never use a cigar or perfume box—and avoid using cotton or any similar substance as packing. Pre-pay the full postage, or the express charges, as the case may be. An answer to questions concerning any fruit received at the office in proper condition, free of expense, is all that should be expected of us.

A Grindstone Treadle.—The position of the grindstone treadle in the article in the September *American Agriculturist*, page 362, is objected to by O. H. Leavitt, Hillsborough, N. H. He writes us: "When the treadle is hung at one end, and attached to the shaft in the middle, the foot of the operator needs to move through too much space. Fasten the treadle in the middle and attach the connecting rod at one end while the foot works upon the opposite end of the treadle."

Cedar Hedge.—Alfred Trigge, writes us from Hamilton, Canada, that he proposes to set out a Cedar hedge, and asks whether to plant in fall or spring. In cold localities like yours, spring is the better time. The lot to be inclosed by the hedge has now a board fence. The hedge should be planted several feet from the fence; it would be better to remove the fence before planting, and protect the hedge by a temporary guard of rails or strips. If the hedge is for shelter, Arbor Vitæ, Norway Spruce, or Hemlock, are preferable to Red Cedar, which is of very slow growth.

To Bleach Sponge.—J. E. Thompson, Volusia Co., Fla.—Before sponges are bleached, they should be freed of all the foreign matters they contain. These are sand and small stones, and shells, or fragments of shells. The sponges should, when dry, be thoroughly beaten and shaken, so long as any sand, etc., can be removed. Any bits or shells that still remain, may be dissolved out by means of Chlorohydric (Muriatic) Acid, diluted with about twenty parts of water. The bleaching liquid is made by dissolving what will of Bleaching Powder, the Chloride of Lime of the shops, about an ounce to a pint of water. When this solution has settled, pour off the clear liquid, and add the sponges just squeezed out of the acid water. After bleaching, the sponges should be washed repeatedly, until all traces of the bleaching liquid are removed. A good authority states that sponges may be bleached very white by a process that we have not tried. After the sponges have been cleansed as above, they are to be immersed in a solution of Hyposulphite of Soda, to which a small quantity of diluted Muriatic Acid has been added. No quantities are given; these must be determined by experiment. The Hyposulphite is not an expensive chemical, and is largely used in photography. We should try it at first in the proportion of an ounce of the salt to a pint of water, and increase the proportion if necessary.

Photographs for Everybody.—We are surprised at the cheapness with which a complete outfit for taking photographs may be obtained. The "Gem Camera," for example, is furnished by the Boston Camera Company, Boston, Mass., for five dollars, including all accessories for field work.

The Enterprise Meat Chopper.—We noticed this new and effective chopper when it first appeared. One of our associates was agreeably surprised on a visit recently made to the Enterprise Manufacturing Co., Philadelphia, to find over one hundred and fifty men working on their celebrated Meat Choppers, of which they have no doubt they will sell one hundred and twenty-five thousand this year.

A Great Premium List.

The most tasteful, attractive, practical and desirable Premium List ever prepared, is presented with this October number to our friends and readers. It embraces about everything every member of every family wants—both useful and ornamental—selected with great care personally by the Publishers and Editors of this Journal, to meet the tastes and wants of its readers. All of the hundreds of these premiums can be secured without money, and with only a little labor. They are supplied to us at special prices by manufacturers, when not specially made for us, so that we are enabled to furnish them to our readers at very favorable rates. They are sold to, or made for us, at cheaper prices than for the regular trade, because of the public attention drawn to them, and their manufacturers, through the columns of the Premium List, which are printed by the hundred thousand. We are consequently able to supply them to our readers at correspondingly less prices. Never before was there such an opportunity presented for getting good things at good bargains. Several premiums, which have proved popular in past years, we again offer this year. Though a better quality of goods has been secured in many cases, we offer them at the same, or lower prices.

P. S.—It should be remembered that no name can in any case be counted for more than one premium. For example, the name of one who has already received the *American Agriculturist* Family Cyclopædia cannot be again counted towards another premium.

All About the Great West.

One of our Editors continues, on another page, notes of his recent extended tour through the far Western States and Territories. These Editorial notes will appear from month to month. But turn to page 476, Premium List, for the names of residents in the States and Territories, who are willing to answer letters, and give information regarding their respective localities free of charge.

Fearless Two-horse Power, positively **unequaled** for ease of team and amount of power, and Clover-huller that gives the most **unbounded** satisfaction. With this machine, shown above, as much money can be earned per day as with a Railway-power grain thrashing machine. **Try It.** Fearless grain Threshers and Cleaners, Wood Circular-saw Machines, Fanning-mills and Feed-cutters, not excelled by any. Buy the best. Catalogue sent free. Address, **MINARD HARDER, Cobleskill, Schoharie Co., N. Y.**

Extract from a letter written by John E. Roberts, of West Point, Ga., President of the National Game Breeder's Ass'n., in the Virginia Poultry Messenger.

"Not long ago, a correspondent writing to me regarding his fowls, and the diseases to which they had been subject, gave me his cordial acknowledgement for naming to him, *not a panacea for all the ills and woes of a chicken's life*, but a good common sense remedy for seven-tenths of their diseases. This is nothing more nor less than a standard preparation of Liebig Co.'s Arnicated Extract of Witch Hazel. If there be any article of sterling value it is this. For several years I have used it constantly, and in the earlier stages of cholera it is a certain cure; in the latter and more critical period it will cure a much larger percentage than any other preparation, and I have tried them by scores. For roup and catarrh in poultry, if applied with care, I have found it a most invaluable agent, the happy effect being at once apparent and satisfactory. But there is one thing that has long been a *bête noir* to breeders of Game fowl, for which this preparation is specific and unfailing in action. This is canker mouth and canker of the throat. Game fowls will fight, will pick each other up about the mouth, tearing out its lining about the head, eyes, &c. Before I began using Liebig Co.'s Arnicated Extract of Witch Hazel, I lost many cases, despite the use of all of the old and well-known remedies. Since its use, however, canker has no more terror than does the bleeding of a stag's comb after being trimmed. The preparation to which I have reference will cure ninety-nine cases out of a hundred. It is a grand medicine, and can be bought so reasonably by the bottle, or in bulk, that every poultry man should have it. For three years, in my letters to patrons and friends, I have invariably suggested its use, and when adopted, their thanks to me has been the inevitable result."

COL. F. D. CURTIS, OF CHARLTON, SARATOGA CO., N. Y., says: "I consider your Arnicated Extract of Witch Hazel to be a most valuable remedy for both man and beast. Every farmer ought to have it on hand. A handy and effectual remedy of this kind is what farmers have required, and with it much suffering can be saved, and no doubt many animals."

T. J. McDANIEL, Esq., of Hollis Center, Maine, and celebrated as a *Raiser of Choice Breeds of Poultry*, says: "I have made use of the Arnicated Extract of Witch Hazel in Chicken Cholera, and it saved nearly all. I gave 20 drops at first and about 15 to 20 drops 3 times a day until the fourth day, when they would generally eat grain whole. I also tried it on a fowl having Vertigo or Dizziness, and it cured the difficulty, etc., etc."

STABLES OF T. BURHAUS,
115 W. 50TH STREET, N. Y.

"I have used Liebig Co.'s Arnicated Extract of Witch Hazel very extensively among horses, and I have found it an invaluable remedy to have about. I have cured quarter crack, splint, rheumatism, sprains, &c., &c., with it. Several old standing cases of quarter crack, which had existed a great length of time and had been pronounced incurable, were speedily cured by it. The number and variety of horse ailments which it will relieve and cure, makes it not only the best, but also the cheapest veterinary liniment to live stock owners."

T. BURHAUS.

Equally emphatic testimony from General Withers, Hon. K. P. Battle, Pres't University of North Carolina, Major Thos. W. Doswell, and hundreds of Farmers, Stock Raisers, Physicians, Surgeons, and Veterinarians.

A WORD

to the public as to our preparations.
1 We never use clap-trap in pushing our goods.
2 We guarantee in quality and honesty in preparation.
3 We sell honest preparations at honest prices. Buyers who look for cheapness regardless of intrinsic merit, need not come to us.

LIEBIG COMPANY'S ARNICATED EXTRACT OF WITCH HAZEL

is a compound of genuine full strength Arnica and pure Witch Hazel. It will cure many of the commoner ailments of Horses, Cattle, Sheep, Swine, Dogs, Mules, Poultry.

It will cure Human Beings of Piles, Salt Rheum, Ulcers, Rheumatism, Diarrhea, Dysentery, Varicose Veins, Burns and Scalds, Catarrh, Neuralgia, &c., &c.

Full and detailed information may be obtained from our circulars, to be had by addressing the

THE
LIGHTNING HAY KNIFE
IS THE
BEST
KNIFE IN THE WORLD!
To Cut HAY & STRAW from the Mow, Stack, or Bundle.
To Cut CORN STALKS or BALED HAY, or Unthreshed OATS in bundles, into Fine Feed.
To Cut ENSILAGE from Silo. To cut PEAT, and Ditching in Bogs and Meadows, severing grass roots, and cutting off bush roots an inch through, readily. Farmers having any of this work to do, should not be without a Lightning Hay Knife, and would not, after an hour's trial. If you feed only a horse or cow, it will PAY YOU to have a Lightning Hay Knife, to cut fresh hay from the side of the mow or stack, instead of pitching from the top, where it is drying up and losing its best qualities. IT PAYS to use a Lightning Hay Knife to cut a load of Chimney Clover Hay into sections, so as to pitch off easily. This is THE KNIFE which Cuts Frozen Hay readily. Manufactured only by
HIRAM HOLT & CO., Me., U. S. A.
For sale by Hardware Merchants & the trade generally

RIDGE'S FOOD FOR INFANTS AND INVALIDS

is without doubt the very best of the many foods now in the market. Its great popularity is due to its intrinsic worth, as by observing "Special Directions" not only will the feeblest infant be nourished without distress, but it will furnish a full meal for the healthy, growing child. It produces bone and muscle, not a puffy, flabby skin. For prevention of (and as a dietetic in) Cholera Infantum, Diarrhoea, etc., it is invaluable. **Ridge's Food has successfully reared more children than all other foods combined.** 4 sizes: 35c., up. Send for pamphlet (free), entitled "Healthful Hints."

LOVELL'S SONS**, Boston, Mass.

American Agriculturist.

VOLUME XLIII.—No. 10.

SUPPLEMENT TO OCTOBER, 1884.

NEW SERIES—No. 453.

✻ H + WONDERFUL + HISTORY. ✻

Very few Americans who have passed the age of forty years can truthfully say with Canning's Knife-Grinder "Story, bless you, I've none to tell sir!" Still less can a journal, nearing its semi-centennial year, be without a history. Like a young forest tree, the journal has in early life its "struggle for existence," and its passing two-score years may be ascribed to "the survival of the fittest."

Like that of a tree, the history of a live journal is one of growth and development, each year accumulating strength, which enables it to bear increased annual crops of useful fruitage, with which to refresh and encourage its vast multitudes of readers.

The first number of the *American Agriculturist* was issued in April, 1842, close to where the New York Post Office now stands, with A. B. Allen and R. L. Allen, Editors, and George A. Peters, Publisher. A copy of this first number, now before us, presents a marked contrast to the issue for October, 1884. The paper then comprised thirty-two pages, which were seven and seven-eighths inches long, by five and one-eighth inches wide, and of two columns each. A page of the first number contained nine hundred and thirty words; the pages now average two thousand three hundred and seventy-six words. The first item in the first number, states that it had been intended to issue it at the beginning of the year, but "unavoidable circumstances have prevented either

of the editors from coming to the city." An address "To Our Readers," indicates the proposed course of the paper. To this "address" is appended a resolution passed by the "Board of Agriculture of

Iowa, on Western Prairies, Ezra Carpenter of Ohio, on Raspberries; Lewis F. Allen, a brother of the editors, had an article on Grass Lands; C. N. Beament describes the Shorthorn bull "Washington"

(also known as "Champion"), one of the first of the breed imported. T. C. Peters (of Georgia) wrote from London, Eng., on "English Farming Stock." At that time the now important State of Wisconsin was a Territory. Geo. Reed, Cor. Secretary of the "Territorial Agricultural Society," writes about the organization, and asks questions about swine. A venerable lady of eighty discusses "The True Interests of our Country," there are several shorter articles, and Mr. A. B. Allen commences his "Agricultural Tour in England," which was continued throughout the first volume. In the first number there are two illustrations; the Shorthorn bull, which is mentioned above and a Sub-soil plow.

When we turn to the advertisements, now so important a feature for both publishers and readers, we find there are but four, two of which only were from parties not connected with the paper. Of those who wrote for the first number, the Messrs. A. B. Allen, L. F. Allen, and T. C. Peters, remain occasional contributors to these pages.

The paper continued to be published in the form of the first number for the first ten volumes,

the American Institute," commending Mr. A. B. Allen and his proposed journal in fitting terms. Solon Robinson wrote for the first number from

under different publishers. The Messrs. Allen afterwards established their own printing office, and the *American Agriculturist* was published from their

building in Water Street. The pages were then enlarged considerably in size, and for two or three years the journal was issued weekly, but the monthly form was afterwards resumed and it is still maintained as the most desirable of all forms. The steady increase in circulation shows that the subscribers have preferred the *American Agriculturist* as a monthly. The volume for 1853 was announced to be "under the joint editorial supervision of A. B. Allen and Orange Judd." The office removed in 1860 to Park Row, then to Broadway.

Early in the year 1861 Mr. M. C. Weld was called from Hartford, Conn., to take editorial charge. He subsequently entered the army; soon after Dr. George Thurber commenced his editorial labors with this journal. In 1863, Mr. Weld returned as Colonel Weld, and resumed his editorial relations.

From the beginning of the volume for 1856, up to, and including the number for August, 1864, each issue of the paper bore upon its heading, "Orange Judd, A. M., Editor and Proprietor." The number for September, 1864, had this changed to "Orange Judd, A. M., Publisher and Proprietor." This was the official announcement that he surrendered editorial labors to others—labors which

1842.—Then and Now.—1885.

The outline of the principal features of the first number of the *American Agriculturist* already given, will enable recent subscribers to compare the outset of its career with the journal as it is at present. Though time rapidly diminishes their numbers, there are still many who, beginning with the first volume, have made the journey of the past forty-two years in our company. These have followed the career of this journal and have watched its steady growth from small beginnings, until it attained a position of popularity and usefulness unequalled in the history of agricultural journalism.

Constantly Onward and Upward.

The course of the *American Agriculturist* has been one of continuous improvement. Onward and upward has been the aim, and in pursuance of this course, all have striven to make each volume—indeed, each number, excel the previous one. As the journal has prospered, its subscribers have shared its success, as they are given more and better

other, and to make brighter and happier the many thousand households in which it is a welcome visitor. The boys and girls are soon to become—at least we hope they are—farmers and farmer's wives. In providing reading for the young folks, we are careful that it shall be instructive and relate to rural matters, with a view to attract them to the farm, to make them see its many interesting features, and to prefer a rural life to any other. In short, while it is a paper for farmers, we wish it to make farmers also.

For the Germans.

Our German farmers and gardeners yearly increase in number, and they specially need the best of instructions as to the new conditions of climate, soil, crops, etc., with which they, as immigrants, are surrounded. The German edition of the *American Agriculturist* is of great service to all such new comers, and others, who read only the German language. The *Amerikanischer Agriculturist*, now in its twenty-seventh year, embodies all the most important articles and engravings of the English edition, with additional matter prepared to meet the wants of its German readers. We have

OUR EDITORIAL STAFF AND CONTRIBUTORS for 1885.

The same Editors who have been conducting the AMERICAN AGRICULTURIST for many years past, are still giving valuable thought and labor to its columns. Among the regular and special contributors are the following able authorities and writers:

were never afterwards, to any extent, resumed. From that time (twenty years ago), until the present, Dr. George Thurber, assisted by Joseph Harris, Col. M. C. Weld, Andrew S. Fuller, and Dr. Byron D. Halsted, and others, has had editorial charge of the *American Agriculturist*. Eight years ago the present owners were called to take control of the Company publishing the *American Agriculturist*.

"Cheapest and Best."

The above is what thousands of our subscribers say for the *American Agriculturist*. Notwithstanding that the size of this journal has more than doubled, that all the matter is original, and that the engravings are vastly improved and increased, —in number four-fold—the price is to continue \$1.50 per year, single numbers 15 cents.

reading matter, illustrated by a greater number of more finely executed engravings, no expense being spared by the Publishers that would secure improvement in our Editorial or Mechanical departments.

For the Entire Family.

The leading object of the *American Agriculturist* is of course to aid the cultivator of the soil to improve his methods, and increase the returns from his labors in any of the many different departments into which agriculture is divided. The farmer's wife is usually his housekeeper, and the prosperity of the farm largely depends upon the management of the household. Knowing the many cares and the continuous labors of the farmer's wife, the *American Agriculturist* does all in its power to diminish the one and lighten the

thousands of subscribers in various German speaking countries, who take this journal to prepare themselves for a rural life in the United States.

The *Amerikanischer Agriculturist* is a most appropriate present for an employer to give a German workman, or for a German here to send a friend at home. It is supplied at the same low rate as the English edition, that is, \$1.50 a year, post-paid.

East, West, North, and South.

The *American Agriculturist* has contributors in most of the States and Territories, and is designed for all sections of our vast country. Though published in the Metropolis, where the facilities for making a first-class illustrated journal are most complete, it pays special attention to the needs of the farmers of the Far West and other remote portions.

H.W. JOHNS' ASBESTOS Liquid Paints

Are the purest, finest, richest, most durable and economical paints ever made for structural purposes.

From *American Agriculturist*, November, 1880.

"Through a number of years the H. W. Johns M'fg Co. have established an enviable reputation for making liquid paints that are remarkable for their durability and beauty. Their Asbestos Liquid Paints have real merit, and all who contemplate painting their farm and other buildings should bear this in mind. We can gladly refer the reader to our recommendations of this firm and its paints in the past."

Samples of Colors, Descriptive Price List, and Copy of our Pamphlet,

"Structural Decoration,"

with illustrations of prominent buildings and other structures painted with our paints, showing colors used, etc., will be mailed free upon application.

We also manufacture in seven colors

Roof, Railroad and Sea-side Paints,

also adapted for Barns, Fences, and rough wood-work. Samples will be sent free by mail.

From *Manufacturer and Builder*, June, 1884.

The H. W. Johns Manufacturing Co., 87 Maiden Lane, New York, have issued in very attractive form, an illustrated pamphlet bearing the title "Structural Decoration," which is devoted to advocating the more liberal use of colors in the decoration of cottages, villas, etc., and particularly to the advocacy of the merits of the well-known Asbestos Liquid Paints of their manufacture. These paints are now so well-known, by reason of their very extensive introduction in all parts of the country, that it will be telling an old story to make more than a passing allusion to their merits.

The pamphlet, besides describing the nature and quality of the asbestos paints, gives a number of well executed engravings of prominent public buildings, hotels, railway companies and structures which have the paints in use. In the extensive list of these, we notice the Capitol at Washington, the Metropolitan Elevated Railroad of New York, and many of the leading railway companies, and summer resort hotels.

Mr. Johns has the honor of being the pioneer in this country of the asbestos industry, and to his numerous improvements, in the processes for utilizing this product, and his energy and business skill, the building up of the asbestos industry to its present large proportions, is very largely due.

Be sure and get the GENUINE, which are manufactured only by

Strangers in Large Cities.

One whose life has been passed in the country, is at once recognized in the crowded streets of a city. It is not any difference in dress that proclaims him a stranger, but finding himself among new surroundings, every movement shows that he is unused to them. The city dweller passes in the crowd, unconsciously avoiding contact with others, and sees in every direction without appearing to be on the look out. In crossing a crowded thoroughfare, the stranger at once shows that he is unused to the situation. Some one has boastfully said: "it requires more talent to cross Broadway, than to be mayor of some cities." The stranger stands upon the curb-stone of some crowded street, and when he thinks there is an opening, starts across at full speed, usually to come in contact with some vehicle, which turns him back to his starting point. The city dweller in crossing the street, drops into the current of vehicles without hurrying, he goes by the side of one wagon, crosses to another, and without going out of a walk, threads his way across in ease and safety. In all large cities there are gangs of rogues to prey upon strangers. Their usual method is to accost a stranger with, "Ah! Mr. Smith, how do you do? How did you leave all the good people at Greenville?" If the good-natured stranger replies, "my name is not Smith, but Jones, and I am from Brownsville," the rogue apologizes for his mistake, telling him of his resemblance to Smith. This answers the purpose of beginning a conversation, which often results in the stranger being led to some rendezvous, where, on one pretext or another, he is swindled out of the ready money he may have, and is fortunate if he is not induced to sign a check for more.

So frequently has this game been played, that one visiting a city should avoid the advances of all strangers, especially those who claim acquaintance, or assert that they know his relatives or neighbors. If one wishes to make inquiries in the streets, he should never address those that stand at the street corners, or hang about the entrances to hotels. If necessary to ask for information, apply to a policeman if one is within reach, if not, step into some store to make the inquiry. One unused to traveling, often feels quite lonely, and is ready to welcome the advances of strangers. Great caution is needed here, as rogues often travel for the sole purpose of plying their swindling trade. Avoid all confidences with strangers, and especially do not state the object of your visit to a city, or accept of

the services of a stranger as a guide to a hotel or boarding place. Be especially careful about showing money; keep a few dollars handy for immediate use, and keep the rest well secured.

Make Ready for the Cholera.

While the health officers can do much to keep out the cholera, and to control it should it gain an entrance, they do not relieve individuals from

some house often has at the rear a sink drain ending nowhere, or a vault that is dangerous to the neighborhood. It is well for each one to set his premises in order to receive the cholera. Let every sink drain be made to carry all wastes far away from the house, and let the vault be at once transformed into a dry earth closet. Carbolic acid (erude) and Sulphate of Iron (copperas) are cheap disinfectants, and should be freely used. Cleanliness of person should be observed, and undue exposure and over exertion avoided. The food should

be plain and nourishing, and care taken that vegetables are fresh and fruits thoroughly ripe. The condition of the bowels should be watched. An attack of cholera usually begins with a diarrhoea, and every manifestation of this kind should be promptly attended to. One so attacked should at once lie quiet, be well covered, and kept warm, and a physician sent for.

It is only in the first stage, that of simple diarrhoea, that domestic treatment can be relied upon, as the conditions that follow require a varied treatment, according to the violence of the attack. A very useful preparation to keep at hand in case of a sudden attack, and to use until medical aid can be had, is *Chlorodyne*, which is made by every competent apothecary. This contains Chloroform and Morphia, with Oil of Peppermint and Capsicum (Cayenne Pepper), and some other stimulants. It is given in doses of twenty drops to a teaspoonful, according to the violence of the attack. At the time of one of the early visitations of cholera to this country, a then prominent physician, Doctor Reese, if we mistake not, published in the "N. Y. Sun" a formula for a mixture to be taken upon the first attack of cholera, or any other disturbance of the bowels. This was copied far and wide as "The Sun Cholera Mixture," and the preparation is to

this day kept under this name by the apothecaries of New York City and elsewhere. This consists of:

- Tincture of Opium (Laudanum).
- " Camphor (Spirits of Camphor).
- " Rhubarb.
- " Oil of Peppermint (Essence of P.).
- " Capsicum (Cayenne Pepper).

Equal parts of each, mix, and shake before using. Dose for an adult: Half a teaspoonful in water, taken after each movement. This has been found useful for the prompt treatment of diarrhoea, whether it is a precursor of the cholera or not, and will prove a valuable addition to the family medicine chest kept in readiness for emergencies. All discharges from patients with any affection of the bowels should be disinfected with carbolic acid, and buried where there can be no contamination.

certain duties to himself and the community. While there is much to be learned about the disease, two points appear to be well ascertained. Filth is favorable to the propagation and development of cholera, and the disease is not contagious in the proper sense of that term, but is communicated by the matters discharged by the patient. No one can predict in what part of the country the epidemic may first make its appearance, and it becomes the duty of every citizen to act as a Health Officer, and put his own premises in proper sanitary condition. Cities often have quarters and streets in such a foul condition as fits them to be hot beds of disease and breeders of pestilence. Villages and farms ought not to be open to a similar charge, but in many cases they are. A hand-

Croup, and its Cure.

This disease is with good reason dreaded by most mothers, for comparatively few families of children grow up without its manifestation among them in at least a light form, and no one knows that it will not speedily assume a dangerous stage. "Nellie Burns" writes to the *American Agriculturist*: In providing for winter, the family medicine chest should have due attention. Much serious illness, and sometimes that which would be fatal, may be prevented by having some simple remedy immediately at hand. Especially is this the case with croup, a dangerous disease, with which a child may be suddenly attacked at night—perhaps when a physician cannot be easily procured. This quickly working disease can usually be speedily subdued by immediate application of proper remedies, while by a little delay it may get beyond the reach of human help, or at least be more difficult to cure than if checked at once.

After years of experience with crouping children, I find the following treatment most effective. Always keep a bottle of sweet oil, and either plenty of "hive syrup" or tartar emetic, in powders suited to the age of the child. At the first croupy cough, which is an unmistakable sound, wrap the child in a warm woolen blanket, and hold it with its feet to the fire, to induce perspiration as quickly as possible. Also give at once "hive syrup" or the tartar emetic powder. If the latter, mix it with a little warm water and sugar. Also rub the throat, chest, and soles of the feet with sweet oil, and saturate a piece of flannel with the oil, heat it as hot as can be borne, and wrap it around the neck. The child will have little relief until it vomits, when it will fall into a restless sleep. Keep it in a warm room during the night, occasionally reheating the flannel on the neck.

Croup rarely spends itself in one night, but is apt to return a second and third night, often growing more severe with each return. So it is highly important to have the child well protected and kept in a warm atmosphere during the day.

Mix together a cupful of molasses, a quarter of a cupful of butter, and sufficient cayenne pepper to give it a sharp taste. Let the mixture boil several minutes. Give the child a teaspoonful every hour until it is relieved.

The dry method of inducing perspiration in croup is safer than to immerse the child in water, as there is danger of taking fresh cold while undressed, and in being removed from the bath; and further, a suffering child will not submit to being placed in water without crying, which will produce choking and coughing, much to its discomfort.

[A mother who has had much successful experience in treating croup among her own children and others, tells us she keeps syrup of ipecac, sweet oil, paregoric, and camphorated oil (or volatile liniment) in the house. At the first croupy sound the child is wrapped very warmly, and its feet heated in mustard water as warm as it can be borne. At the same time she begins giving syrup of ipecac in small doses, from fifteen to thirty drops, according to the age, repeating it every half hour until free vomiting is secured. The neck and chest are bathed in cam-

phorated oil, and kept warm with cotton batting or several layers of soft flannel. After vomiting, and sleep if it occurs, a teaspoonful of a cough mixture (less to an infant) is given every three or four hours, until all croupy symptoms disappear. This cough mixture, which is excellent for any cough, is simply a mixture of equal parts of sweet oil, paregoric, and syrup of ipecac, and should be kept on hand.—Ed.]

Salads are Good.

We advocate the use of salads because they are good. They introduce a pleasant variety in the

sumes a rich creamy consistence, and is perfectly smooth. In making a salad-dressing, considerable variety may be introduced in the flavoring. The main ingredients are oil (or some substitute), vinegar and flavoring; besides these, the yolks of hard-boiled eggs, rubbed up fine, are added to give substance and smoothness to the mixture. The following will give a good dressing: The yolk of a hard-boiled egg is broken up in a dish with a wooden spoon, adding salt and pepper, and a little cream to moisten the egg; when this is reduced to a smooth paste, add gradually two tablespoonfuls of cream, or melted butter, one teaspoonful of vinegar, and about half a teaspoonful of made mustard. The ingredients should be added slowly, and stirred thoroughly. This dressing will answer for many vegetable salads, as well as those consisting in part of meat or fish. It can, of course, be varied in its seasoning according to the taste of the maker.

VEGETABLES SUITABLE FOR SALADS.—Among the vegetables that can only be used in warm weather, unless they are forced under glass, are: lettuce, water-cresses, radishes, endive, dandelion, (both of these blanched), chives, cucumbers, and tomatoes. Winter vegetables to be used raw are celery, cabbages, and onions. The vegetables which must first be cooked tender are beets, cauliflower, asparagus, potatoes, string or snap beans, and celeriac or turnip-rooted celery. Two or more vegetables may be mixed if desired. For vegetables to use as the basis of meat and fish salads, celery and cabbage are best when lettuce is out of season. For flavoring vegetables, chives, onions or shallots, tarragon and parsley are the principal. Parsley may be had fresh all winter, by setting some roots before the ground freezes in a box of soil, which is to be kept in the sunny kitchen window.

POTATO SALAD.—A potato salad, a favorite with many, is made by slicing cold boiled potatoes very thin, sprinkling finely cut chives (or onion), and parsley among the slices, using salt and pepper, and adding oil and vinegar enough to thoroughly moisten the potatoes. Where the oil is objected to, it may be omitted, as it is very good without. We have not tried any substitute for oil in potato salad.

By a proper admixture of vegetables, various kinds of meat and fish salads may be compounded. Chicken salad is to the majority known only by name, and looked upon as a dish for those who do not count the cost in furnishing their tables. Not only will chicken, turkey, or other fowl or bird afford the basis for a delicious salad, but the scraps of meat of most kinds, beef, mutton, etc., may be economically used to make a meat salad, which, if once tried, will be quite sure to be repeated, and from materials that too often go to the pigs. The families of farmers are often obliged to live largely upon salted meats, sometimes to the injury of their health. It is well known that vegetables, especially when eaten raw, tend to correct the unfavorable effects of salt meats, and prevent the tendency to a form of scurvy which such a diet often causes. Salads add a welcome variety to the usual winter fare and improve the general health.

food. In warm weather they are more acceptable than heavy meats, and may be made sufficiently piquante to aid the sluggish digestion, while at all other seasons they are welcome by their freshness and flavor. But the oil! there is a very common aversion to oil, especially among those who have not been accustomed to its use. It is often asserted, that a good salad cannot be made unless olive oil is freely used in dressing it. If people do not like oil, or think they do not, let them make their salad without it. Only the very best oil should be used, and that is expensive. Just as good a salad dressing can be made by substituting cream or butter for oil, according to the kind of salad. The butter should be of the best kind, and not heavily salted; in any recipe for salad-dressing, substitute melted butter in the same quantity as directed for oil. The butter should be melted very gently, and only sufficiently heated to liquify it. If, in mixing the other ingredients with the butter, that solidifies too soon, set the dish in a pan of warm water, until the mixture is complete and the dressing as-

A RARE OFFER

\$1 Worth of SHEET MUSIC FREE

Buy fifteen bars of Dobbins' Electric Soap of any grocer; cut from each wrapper the picture of Mrs. Foggy and Mrs. Enterprise, and mail to us, with full name and address, and we will send you free of all expense, your own selection from the following list of Sheet Music, to the value of One Dollar. We absolutely GUARANTEE that the music is unaltered, and sold by first-class music houses at the following prices:

INSTRUMENTAL.		Price
Artist's Life Waltzes (Kunster Leben), op. 316, Strauss		75
Ever or Never Waltzes (Tonjours on Jamais), Waldteufel		75
Chasse Infernale, Grand Galop, Brilliant, op. 23, Kolting		75
Turkish Patrol Revellie,	Krug	35
Pirates of Penzance, (Lancers),	D'Albert	50
Sirens Waltzes,	Waldteufel	75
Patinitz, Potpourri,	Suppe	1 00
Mascotte, Potpourri,	Audran	1 00
Trovatore, Potpourri,	Verdi	75
Night on the Water, Idyl,	op. 33, Wilson	60
Rustling Leaves,	op. 63, Lange	60
VOCAL.		
Patience, (The Magnet and the Churn),	Sullivan	35
Olivette, (Torpedo and the Whale),	Audran	40
When I am Near Thee, (English and German words),	Abt	40
Who's at my Window,	Osborne	35
Lost Chord,	Sullivan	35
My Dearest Heart,	Sullivan	35
Life's Best Hope,	Meininger	40
Requited Love, (4 part Song),	Archer	35
Sleep while the Soft Evening Breezes, (4 part Song),	Bishop	35
In the Gloaming,	Harrison	30
Only be True,	Vickers	35
Under the Raven,	Wagner	35
Free Lunch Cadets,	Sousa	35

If the music selected amounts to just \$1, send only the 15 pictures, your name and address. If in excess of \$1, postage stamps may be enclosed for such excess.

We make this liberal offer because we desire to give a present sufficiently large to induce every one to give Dobbins' Electric Soap a trial long enough to know just how good it is. If, after trial, they continue to use the soap for years, we shall be repaid. If they only use the fifteen bars, retine the dollar's worth of music gratis, we shall lose money. This shows our confidence. The Soap can be bought of all grocers—the music can only be got of us. See that our name is on each wrapper. Name this paper.

A box of this Soap contains sixty bars. Any lady buying a box, and sending us sixty cuts of Mrs. Foggy, can select music to the amount of \$4.50. This Soap improves with age, and you are not asked to buy a useless article, but one you use every day.

I. L. CRAGIN & CO. 116 S. Fourth St. Philadelphia.

In ordering music, mention this paper.

EVERY LADY SHOULD SUBSCRIBE FOR STRAWBRIDGE & CLOTHIER'S FASHION QUARTERLY.

Every Number contains: Nearly ONE Thousand Engravings, illustrating the new things in every department of fashion.

TESTED AND ENDORSED BY 100 AGRICULTURAL PAPERS.

— READ A FEW EXTRACTS. —

The American Agriculturist, New York : We have given this Meat Chopper a thorough trial, with most satisfactory results.

Farm and Fireside : The test was made on a piece of the toughest beef to be found, and the result was that each editor immediately ordered an ENTERPRISE MACHINE for his family use, all agreeing that they would rather pay the price asked for that Machine than to carry any other home as a gift.

The American Grange Bulletin, Cincinnati, O. : We have tested the Enterprise Meat Chopper, and find it very satisfactory.

The North American Farmer, Raleigh, N. C. : The Meat Chopper is all that is claimed for it, and is, indeed, a wonderful machine for its size and cost.

The Tribune and Farmer, of Philadelphia : We have given these Meat Choppers a thorough trial and can recommend them to our patrons.

The American Cultivator, Boston : Every farmer should have one.

The Kansas Farmer, Topeka, Kansas : Every family that is fond of sausage, mince meat and good mince pies, should have one.

The Iowa Homestead, Des Moines, Iowa : We have never seen its equal for rapidity, cleanliness and perfect work.

The Farm Journal, Philadelphia : We have tested the Enterprise Meat Chopper, and find it perfect in its operations.

The Steuben Farmers' Advocate, Bath, N. Y. : They are a great labor-saving machine. We have one in use and would not be without it for five times its cost, \$3.00.

Our Meat Choppers are sold by all live Hardware Dealers. If you cannot get one near you, send us the money and we will ship it at once.

AMERICAN AGRICULTURIST

COSTING NO MONEY AND BUT LITTLE LABOR.

Carefully and Specially Selected to Meet the Wants and Tastes of our Great Family of Readers.

Hundreds of Articles you would otherwise have to purchase, procured free through this channel.

PREMIUM RULES.—All Collecting Premium Names should Carefully Note the following:

1st.—One can close his list of names at any time, and call for the premium or premiums due; or the list of names can be added to all the while up to June, 1885. BUT

2d.—Send along the names as fast as gathered (with the exact money), so that the subscribers may begin to receive the Journal at once. Mark every name, or list of names "For Premiums," if so intended, and we will credit them to the sender in our Premium Record.

3d.—New subscriptions all count for premiums, and renewals count in lists of two or more names, but we expect a fair share of new subscriptions in such lists. Two half year subscriptions count as one full year subscription in premium lists.

4th.—Any person aiming to get a particular premium, but who, after fair effort, or through sickness, or otherwise fails to complete the list, will be allowed a discount on the price of the article, in purchasing it, exactly in proportion to the number of names sent.

5th.—Premiums for single subscriptions are only for new subscriptions obtained and forwarded by the person desiring the Premium. One's own subscription does not

count for a single name premium, but may be counted where there are two or more premium subscriptions.

6th.—All subscriptions for premiums are credited to the Sender, whether the subscribers receive their papers at one Post Office, or at a dozen or more different offices.

7th.—German Subscriptions are at the same rate as the English edition, and count in premium lists. A premium list may be wholly of English, or wholly of German subscriptions, or be made up of a part of each.

8th.—A Specimen Number of the *American Agriculturist*, (English or German), will be sent free, and post-paid to any actual canvasser. A few additional copies, if desired solely for canvassing, will be sent post-paid to canvassers. Price of numbers to others 15 cents each. They are too costly to scatter free.

9th.—Registering Premiums.—Every article noted to be sent post-paid, will be Registered if the Registering fee of 10 cents be sent us.

10th.—Express or Freight Charges are usually low on Premium Articles. The cost can be best learned at one's own nearest express or freight office.

11th.—For a Premium or Purchased article, wanted at a Definite Time, give sufficient notice for us to order it from the Manufactory, and allow for accidental detention on the way; also for crowded factories, and express carriers, and freight trains, about the Holidays.

12th.—No subscription can count towards more than one premium in any case.

13th.—To Foreign Readers:—The above rules about mailing Premiums apply only to the U. S. and Territories. Mailable articles not exceeding 8 ounces go to all British America, except Newfoundland, at 10 cents per parcel, but packages over 8 ounces are excluded from Canada mails.—To all foreign subscribers we will follow any directions given about sending articles from the Premium List.—Subscription and postage rates on the *American Agriculturist* to the Canadas are the same as to United States Post Offices. To Newfoundland, and to all foreign countries embraced in the Postal Union, 20 cents a year must be added to the subscription rates, for extra postage to be prepaid here.

Good Things for All.

The most carefully selected and most attractive list of Premiums the Publishers of the *American Agriculturist* have ever offered, is here placed before their friends, the readers of this Journal. They invite special attention to the descriptions of these valuable and useful articles as found in the following pages. These Premiums are designed to remunerate those who interest themselves in securing and sending subscriptions to the *American Agriculturist*—a service that has been found easy and profitable by thousands who in years past have obtained Premiums from the Publishers.

No Time Like the Present.

The great improvements which, within a few months past, have been made in all departments, have been the occasion of letters of commendation from all quarters. There has never been a time, therefore, so favorable as the present for making known the merits of this Journal, and securing subscriptions.

It will be observed that we have reproduced such premiums as have proved specially popular in former years, in order to enable such readers as have not already done so to procure them.

These Premiums have been selected by the publishers and editors of the *American Agriculturist*, with a view to meet the wants and tastes of our readers. Very many of them have been secured at

much lower prices than rule elsewhere, by reason of our being able to make special low rates with the manufacturers.

Owing to the active competition of various companies, the freight and express charges on our Premium articles are comparatively low. You can ascertain by enquiring at your nearest railroad or express station, what the charges are from New York on any article or articles desired by you, or if you prefer, write us and we will ascertain the charges for you.

Do not hesitate to write us for information regarding any point which is not wholly clear to you. We desire you all to have a perfect understanding as to every Premium offered before you order it.

While these Premiums have been selected with great care for the special benefit of those who work for the *American Agriculturist*, we will supply them for the prices named to those who desire to purchase the articles.

A Profitable Business

has thus been done, for it will be seen that only one subscription a day for a month secures a \$25 Premium article; for two months \$50; for three months \$75; for four months \$100; and there are odd hours in many days and evenings, at fairs and other gatherings, when this can be done without interfering with other regular employment. In canvassing, one is not confined to his own immediate vicinity, but can collect the names and subscriptions wherever he finds them.

Begin To-day.

Immediately on receiving this issue, you can begin the work of collecting subscriptions, knowing that the premiums which you may desire are all ready for you. You can have your subscribers begin with any number of the year. Every number is complete in itself, with no "to-be-continued" articles. Those desiring Premium articles can begin gathering names TO-DAY, and receive the Premiums as soon as earned; or continue enlarging their lists. (See Rules 1, 2, 3, above.)

Present subscribers can join Clubs, and have their time extended a year after present subscriptions expire. New subscribers can, if desired, begin back with any previous month, and receive the back numbers.

How to Send Money:—Send money by Postal Money Order, or by checks or drafts on New York Banks or Bankers, payable to the order of Orange Judd Company. If neither of these is obtainable, send the money by Register Letter, affixing stamps both for the postage and registry. Or, the remittance may be made by Postal Notes, which are supplied at all Post Offices.

All Premium Names for 1885, received with the subscription money (\$1.50 each) during October, can have the November and December issues of this year free; all received during November can have December free.

FREE TO ALL.

Individuals, Societies, or Associations, Farmers' Clubs, or any Others, are invited to secure, as here offered,

GOOD BOOKS FREE.

The Publishers of the American Agriculturist will **PRESENT** to any Individual, or Club, or Association **PROCURING** and sending subscribers to this Journal (including new subscribers and renewals), at the regular rate of \$1.50 each, any of the **BOOKS** described on this and next page, **THUS**:

For 2 Subscribers, Books to the amount of \$1.50 | For 4 Subscribers, Books to the amount of \$3.20
For 3 Subscribers, Books to the amount of \$2.25 | For 5 Subscribers, Books to the amount of \$4.10
For 6 Subscribers, Books to the amount of \$5.00

For **TEN** Subscriptions and upwards: A Dollar's Worth of Books for **EACH** Subscription at \$1.50.

DELIVERY OF BOOKS.—All Books thus GIVEN as Premiums will be delivered at the office of the American Agriculturist, 751 Broadway;

OR they will be packed and forwarded to any address, by express or otherwise, as may be desired, the receiver to pay the charges of carriage;

OR they will be mailed, post-paid, to any part of the United States or British America (except Newfoundland), if the postage money be sent us at the rate of 7 cents for each dollar's worth of Books. (For postage to Newfoundland and to OTHER countries in the Postal Union, send 14 cents on each dollar's worth.)

N.B.—Remember that, aside from the above, any of the following Books will be forwarded, post-paid, on receipt of price.

Sure to Pay.

Nothing is more certain to bring valuable returns in some form to the man who bestows thought upon his calling, and all connected with it, than **Good Books**. From them he learns the experience of others, and writers of some of the best, practical books, have been candid enough to tell us what their mistakes have been, as truly as what their successes have been, so that the reader may avoid the one, and strive to attain to the other. We offer a large list of most useful and valuable

BOOKS

FOR

**Farmers, Fruit-Growers,
Gardeners, Housekeepers,
Florists, Architects,
Stock-Raisers, Sportsmen,**

for everybody indeed, for there are books on our list suited to all who are in any way interested in Farm, Garden, Household, or Rural Life in any form.

To know how to do what one has to do in the best way, and in the shortest time, is of the first importance. What are the best methods in the management and cultivation of the soil? What are the most approved implements? How shall we best care for our live stock? What are the best fruits for our locality? What are the Injurious Insects, and how shall we combat them? These, and hundreds of questions like these, are constantly coming up before the farmer and gardener, and by good books and practical men, he will be helped to answer them, and what is true in this respect regarding the tillers of the soil, is true concerning those engaged in every trade and occupation, whether male or female.

All labor, be it mental or manual, is better done by the intelligent and observant, than by the ignor-

ant and careless. And all the members of a household in which good and appropriate books are at hand for father, mother and children, are happier, better and more useful and helpful to themselves and others about them, than they could be without such aid.

Therefore we hope that every member of the great family of readers of the *American Agriculturist*, will avail himself of the opportunity here offered to become the owner, either by purchase, or, by little labor, as Premiums for subscriptions to this Journal, of many of the valuable books to be found on our catalogues.

The following excellent Books will be **delivered free**, by express or mail, to any part of the United States or Territories, and throughout British America (except in Newfoundland), for the prices named with each.—To all other countries embraced in the Postal Union, they will be mailed on receipt of the price and seven cents extra for each Dollar's worth, to pay the extra postage.

OUR LATEST BOOKS

RELATING TO THE

FARM, VEGETABLE GARDEN, &c.

Practical Forestry.—By ANDREW S. FULLER. A Treatise on the Propagation, Planting, and Cultivation, with a description and the botanical and popular names of all the indigenous trees of the United States, both Evergreen and Deciduous, with notes on a large number of the most valuable Exotic species. Just published. Cloth. \$1.50.

Farm Conveniences.—Various kinds of home-made aids to Farm work are described, and suggestions and ideas from the experience of many practical men are given. With over 200 engravings. Cloth. \$1.50.

New American Farm Book.—Originally by R. L. ALLEN. New revised and enlarged edition by L. F. ALLEN.—The first edition of this work was regarded as the best upon the subjects of which it treated, and the later edition, revised and enlarged, maintains its place in the front rank. Cloth. \$2.50.

The Chemistry of the Farm.—By R. WARINGTON, F. C. S. What all who work upon the soil would be glad to know concerning Chemistry and its relation to their work, is given here. Cloth. \$1.

Elements of Agriculture.—By GEORGE E. WARING, JR. Every Farmer's boy should have this book in his library. It cannot fail to be of value to him. Cloth. \$1.

French's Farm Drainage.—By Hon. H. F. FRENCH. New edition. The effects of draining land with stones, wood, drain-plows, open ditches, and tiles. Also very useful tables. Over 100 illustrations. Cloth. \$1.50.

Soil of the Farm.—By JOHN SCOTT and J. C. MORTON. The Management and Cultivation of the soil. Cloth. \$1.

Gardening for Young and Old.—By JOSEPH HARRIS. Author of "Walks and Talks on the Farm," "Talks on Manures," etc. Both young and old gardeners will be interested and aided by Mr. Harris's counsels given in this book. Cloth. \$1.25.

Truck Farming at the South.—By DR. A. OEWLER, of Georgia. The long and successful experience of Dr. Oewler in this field is here given, and in a manner which can not fail to interest, especially those who contemplate the raising of "Garden Truck" in our Southern States for the Northern market. Illustrated. Cloth. \$1.50.

Harris's Talks on Manures.—By JOSEPH HARRIS. The latest edition of this work contains a chapter especially written for it by Sir John Bennet Lawes, of Rothamsted Farm, and has also been revised and enlarged by Mr. Harris. Cloth. \$1.75.

Sweet Potato Culture.—By JAS. FITZ, Author of "Southern Apple and Peach Culturist." In many of the States further north than Virginia, the Sweet Potato is now cultivated. The information which all who engage in that culture desire, is given in this little work. Paper Covers. 40 cts.

Colorado as an Agricultural State.—Its Farms, Fields, and Agricultural Lands. By WM. E. PABOR, Associate Editor of the "Colorado Farmer." The growth of this State has been wonderful, and this book is of special interest to those who would learn fully about its agricultural resources. Illustrated. Cloth. \$1.50.

Gardening for Pleasure.—Cloth. \$1.50.

Gardening for Profit.—Cloth. \$1.50.

By PETER HENDERSON. No Farmer or Gardener can afford to be without one or both of these books in his library. Ever since their publication, down to the latest and revised editions, they have been regarded as the best books upon the subjects treated.

Brill's Farm Gardening and Seed Growing.—By FRANCIS BRILL. A practical work by one who gives his own experience. Cloth. \$1.

Treat's Injurious Insects of the Farm and Garden. By MARY TREAT.—Most valuable knowledge of Insect Pests of Vegetation may be gained from this important work. Fully illustrated. Cloth. \$2.00.

ORCHARD, VINEYARD, and FLOWER GARDEN.

Fuller's Small Fruit Culturist.—By A. S. FULLER, Author of "Practical Forestry," "Grape Culturist," etc. New edition. The standard authority upon Small Fruits. Fully illustrated. Cloth. \$1.50.

American Grape Growing and Wine Making.—By GEORGE HUSMANN, Napa City, Cal. New and revised edition. No one stands higher as an authority upon Grape Growing and Wine Making than Prof. Husmann, and we have here a record of his own experience, and also that of others of high reputation. Illustrated. Cloth. \$1.50.

Barry's Fruit Garden.—By P. BARRY. New edition, thoroughly revised by the author. From its first issue, this book has held a place in the front rank as a standard authority upon the subject of which it treats, and the author's long, practical experience, which is here related, makes this work of the highest value. Cloth. \$2.50.

Practical Floriculture.—By PETER HENDERSON. The same favor with which Mr. Henderson's two works on Gardening have been everywhere received, has also been accorded to this book. It is thorough, complete, and useful, both to Florists and Amateurs everywhere. Fully Illustrated. Cloth. \$1.50.

*Free to all on application.—We will send free, to any one asking for it, our finely illustrated 32mo. Catalogue, latest edition, describing some three hundred Books upon Agriculture, Horticulture, Field Sports, etc. Our beautifully illustrated 8vo. Catalogue, new edition, containing about one hundred and twenty-five engravings, with descriptions of Books, will be sent on receipt of six cents. Most of the books thus described are offered as premiums, on the same terms as others mentioned.

Peach Culture.—By Hon. J. ALEX. FULTON. The thorough acquaintance of Judge Fulton with this entire subject upon which he writes, makes this revised edition of his work invaluable to all who would learn about Peach Culture. Cloth. \$1.50.

Winter Greenhouses at Home.—By REV. E. A. JOHNSON, D. D. The results of actual practice in Winter Gardening in his own home, are given by Dr. Johnson in this finely illustrated little book. Cloth. \$1.

Window Flower Gardening.—By JULIUS HEINRICH. How to make the windows of a house beautiful, is here taught by Mr. Heinrich, who is himself a practical Florist. 70 illustrations. Cloth. 75 cts.

CATTLE, HORSES, SHEEP, &c.

Allen's American Cattle.—Their History, Breeding, and Management.—By LEWIS F. ALLEN. Mr. Allen is well known as one who has very large experience in improving the character of American herds, and the work which he has produced, which is now revised, easily makes good its claim as a standard authority upon American Cattle. Every breeder of Live-stock should own it. Illustrated. Cloth. \$2.50.

Every Man His Own Cattle Doctor.—By PROF. GEORGE ARMATAGE, M. R. C. D. S. The latest information is here given, as to the causes, symptoms, remedies, nature, and the prevention of all known diseases of cattle up to the present time. With over 350 practical illustrations. Half Morocco. 8vo. \$7.50.

Keeping One Cow.—A number of practical writers have given in this useful little book their experience in the management of a single Milch Cow, and the suggestions made will be valuable to those who keep one or more cows. Cloth. \$1.

Every Man His Own Horse Doctor.—By PROF. GEORGE ARMATAGE, M. R. C. D. S. "Blaine's Veterinary Art" is also included in this volume. It is a most valuable and comprehensive Guide, containing practical, anatomical, and surgical illustrations. Half Morocco. 8vo. \$7.50.

The Saddle Horse.—A Complete Guide for Riding and Training. Those who enjoy Horseback-Riding, of whom there is a multitude, can learn from this little book how best to take that exhilarating exercise. Cloth. \$1.

The Horse.—How to Buy and Sell.—By PETER HOWDEN. It is often difficult to distinguish real from imaginary defects, and to know what is sound and what unsound in a horse; and this little book will tell one how to do it. Cloth. \$1.

The Horse.—Its Variety and Management in Health and Disease.—Condensed from Stonehenge's "Farmer's Calendar," etc. Illustrated. Boards. 75 cts.

The Shepherd's Manual.—By HENRY STEWART. A Practical Treatise on the Sheep, for American Shepherds. New and enlarged edition. Illustrated. Cloth. \$1.50.

Coburn's Swine Husbandry.—By Hon. F. D. COBURN. This most valuable work on the Management of Swine, and Prevention and Treatment of their Diseases, has been thoroughly revised and enlarged by the author in this new edition. Cloth. \$1.75.

Harris on the Pig.—By JOSEPH HARRIS. English and American Breeds are discussed, and the advantage shown of using thorough-bred males. New edition. Illustrated. Cloth. \$1.50.

POULTRY, BEES, AND PETS.

An Egg Farm.—By H. H. STODDARD. One of the best and most practical works upon keeping Poultry in large numbers. Illustrated. Cloth. 75 cts.

Wright's Practical Poultry Keeper.—By L. WRIGHT. A standard and valuable work. Illustrated. Cloth. \$2.

Practical Poultry Keeping.—By G. M. T. JOHNSON. Illustrated. Paper Covers. 50 cts.

Quinby's Bee-Keeping.—By L. C. ROOT. The mysteries of Bee-Keeping explained, combining the results of fifty years' experience with the latest discoveries and inventions, presented in the most improved methods, forming a complete Guide to successful Bee-Keeping. With one hundred illustrations, and a portrait of M. Quinby. New and revised edition. Cloth. 12mo. \$1.50.

The American Bird Fancier.—New Edition. How to manage Song and Domestic Birds. Paper Covers. 50 cts.

Canary Birds.—A Guide for their Breeding, Rearing, and Treatment, and Suggestions regarding Cages, Aviaries, etc. Cloth. 24mo. 75 cts.

ARCHITECTURAL BOOKS.

Cottage Houses.—By S. B. REED, Author of "House Plans for Everybody." For Village and Country Homes, with complete Plans and Specifications. New edition. Cloth. \$1.25.

House Plans for Everybody.—By S. B. REED. Designs of Dwellings are given, costing from \$250 up to \$8000, with estimates of all articles used in building. Cloth. \$1.50.

Barn Plans and Out-Buildings.—This work is the cheapest for the price ever issued upon the subject of which it treats. It abounds in hints and suggestions, and contains 275 illustrations. Cloth. \$1.50.

Carpenters' and Builders' Guide.—By B. W. PLUMMER. A Hand-book for Workmen, and a Manual of Reference for Contractors, Builders, etc. Boards. 75 cts.

Carpenters' and Builders' Assistant and Woodworkers' Guide.—By L. D. GOULD. Containing thirty-six plates, tables of strength of materials, length of braces, technical terms, etc., etc. Cloth. \$2.50.

National Carpenter and Joiner.—By JAMES H. MONCKTON. A complete work on Constructive Carpentry, showing the simplest methods of finding the joints and geometrical forms, including Splayed Work, Groined Ceiling, Framing and Roofing, Domes, Niches, Raking, Level, Moulding, etc. Illustrated by large scale diagrams in two colors. Cloth. \$5.

Carpentry Made Easy, or the Science and Art of Framing on a New and Improved System.—By WM. E. BELL. With specific instructions for building Barn Frames, Mill Frames, Warehouses, Church Spires, etc. Comprising also a system of bridge building, with bills, estimates, and tables, and illustrated with 54 plates. Cloth. \$5.

American Cottages. Containing forty-four large quarto plates, with form of specification for Cottages in the latest styles, from the drawings of a number of architects, securing a variety of plans and diversity of treatment. One large quarto volume. Cloth. \$5.

Modern House Painting.—By E. K. RUSSELL and F. A. WRIGHT, Architects. With 20 colored lithographed plates, showing the use of color in exterior and interior house painting. Also the treatment of old styles of houses. The preparation and application of colors, etc. Oblong quarto. Cloth. \$5.

FISHING, HUNTING, AND RURAL SPORTS.

Superior Fishing; or, The Striped Bass, Trout, Black Bass, and Blue Fish of the Northern States.—By ROBERT BARNWELL ROOSEVELT. New and revised edition. Illustrated. Cloth. \$2.

The Game Fish of the Northern States and British Provinces.—By ROBERT BARNWELL ROOSEVELT. With an account of the Salmon and Sea Trout Fisheries of Canada and New Brunswick, together with simple directions for tying artificial flies, etc., etc. New and revised edition. Illustrated. Cloth. \$2.

Florida, and the Game Water Birds of the Atlantic Coast and the Lakes of the United States.—By ROBERT BARNWELL ROOSEVELT. With a full account of the sporting along our seashores and inland waters, and remarks on breech-loaders and hammerless guns. New and revised edition. Illustrated, and with a portrait of the author. Cloth. \$2.

Our Friend, the Dog.—By GORDON STABLES. A Complete Guide to the Points and Properties of all known Breeds and their Management. Illustrated. Cloth. \$3.

Bogardus's Field, Cover, and Trap Shooting.—By CAPT. A. H. BOGARDUS. Instructions for Young Sportsmen, etc. New edition, revised and edited by COL. PRENTISS INGRAHAM. Cloth. \$2.

* * * New edition of the "Sportsman's Companion." This elegantly illustrated List of some two hundred Books on Field Sports, and Out-Door Life, will be sent to any address on receipt of five cents for postage and wrapping. Most of the works described are offered as premiums, on the same terms as other books on this page.

The Sportsman's Gazetteer and General Guide.—By CHARLES HALLOCK, Founder of "Forest and Stream," author of the "Fishing Tourist," "Camp Life in Florida," &c. The Game Animals, Birds, and Fishes of North America; their Habits and various Methods of Capture. Copious Instructions in Shooting, Fishing, Taxidermy, Woodcraft, &c. Together with a Glossary and a Directory to the Principal Game Resorts of the Country, with Maps. New edition, just published. Revised, enlarged, and brought down to date by the author. Beautifully Illustrated. Cloth. \$3.00.

Scientific Angler.—By the late DAVID FOSTER. Compiled by his Sons. A General and Instructive Work on Artistic Angling. With an Introductory Chapter and copious Foot-notes by WILLIAM C. HARRIS, Editor of "American Angler." Illustrated. Cloth. \$1.50.

The Dogs of Great Britain, America, and Other Countries.—New and enlarged edition for 1884. The Breeding, Training, and Management of Dogs in Health and Disease, comprising the essential parts of the two latest Standard Works by STONEHENGE. It gives the Prize Winners at Dog Shows, down to the last, and describes the best hunting grounds in America. Over 100 engravings. Cloth. \$2.

Stonehenge's Rural Sports.—By STONEHENGE. Comprising Shooting, Hunting, Coursing, Fishing, Hawking, Racing, Boating, Yachting, Pedestrianism, Golf, and Roller Skating. The Standard Encyclopedia of Field Sports. Fifteenth edition, with very many illustrations, re-edited throughout, with numerous additions, by the "Field" Staff. One large octavo volume, half morocco. Recently published. \$7.50.

American Game Bird Shooting.—By JOHN M. MURPHY, Author of "Sporting Adventures in the Far West," etc. The haunts and habits of Game Birds are described, and the various methods employed in this country and Europe for bagging them. Also the best Dogs for Sportsmen, Camp Life, etc. Illustrated. Cloth. \$2.

Practical Taxidermy and Home Decoration.—By JOSEPH H. BATTY. With instructions for Collecting and Mounting Animals, Birds, Fish, Insects, etc. 125 Illustrations. Cloth. \$1.50.

How to Hunt and Trap.—By JOSEPH H. BATTY. One of the most complete and popular works upon the subjects of which it treats. Enlarged and re-written with nearly 100 illustrations. Cloth. \$1.50.

Hints on Dog Breaking.—By WM. FLOYD. A thoroughly practical Hand-book. Illustrated. Cloth. 50 cts.

American Wild Fowl Shooting.—By JOSEPH W. LONG. Describing the haunts, habits, and methods of Wild Fowl. Fully illustrated. Cloth. \$2.

Practical Hints on Rifle Practice with Military Arms.—By C. E. PRESCOTT. Pocket edition, flexible covers. 50 cents.

MISCELLANEOUS.

Ornamental Gardening for Americans.—By ELIAS A. LONG, Landscape Architect. Author of the "Home Florist." On the judicious use of Trees, Shrubs, Flowers, and other materials for beautifying our Homes, Towns, Rural Districts, and Cemeteries, with notes on the Construction and Management of Pleasure Grounds. Just published. Illustrated. Cloth, 12mo. \$2.

Mrs. Elliott's Housewife.—By SARAH A. ELLIOTT. This excellent book, containing practical Recipes in Cookery, had a large circulation in its earlier editions. In this new edition, it has been revised and new matter added by the author. Cloth. \$1.25.

Eggleston's Hoosier Schoolmaster.—Illustrated. Cloth. \$1.25.

Eggleston's End of the World.—Illustrated. Cloth. \$1.50.

Eggleston's The Mystery of Metropolisville.—Illustrated. Cloth. \$1.50.

Eggleston's Roxy.—Illustrated. Cloth. \$1.50.

Eggleston's Circuit Rider.—Illustrated. Cloth. \$1.50.

Eggleston's Hoosier School Boy.—Illustrated. Cloth. \$1.00.

The above six works by EDWARD EGLESTON.

READY OCTOBER FOURTH, 1884.

A Book of Reference for the Various Departments of Human Knowledge.

Including Agriculture, Astronomy, Architecture, The Various Arts and Sciences, Biography, Botany, Chemistry, Engineering, Geography, Geology, History, Horticulture, Literature, Medicine, Physiology, Natural History, Mythology, and many other departments.

700 PAGES AND OVER 1,000 ENGRAVINGS.

CONDENSED, COMPILED, AND ARRANGED FOR CONVENIENT USE.

SPECIMEN PAGES, SHOWING SIZE OF PAGE, STYLE OF TYPE AND ILLUSTRATIONS.

DIRK

267

DISCOPHORA

FRICTION-BALLS

352

FRINGE

Dirk, derk. A dagger formerly much used in the Highlands of Scotland, and still worn as essential to complete the Highland costume.

Dirk.

Dirt-eating, dert'et-ing. Cachexia Africana, a disorder of the nutritive functions among negroes, and in certain kinds of disturbance of the feminine health, in which there is an irresistible desire to eat dirt. The practice of some tribes of S. America, of using certain kinds of clay for food.

Discharger, dis-ehärj'er. In Elect. an instrument for discharging a Leyden jar, &c., by making a connection between the two surfaces. In calico printing, a discharge.

Leyden Jar with Discharger.

Discharge-valve, 'valv. In steam-engines, a valve which covers the top of the barrel of the air-pump and opens upward.

Discharging Arch, 'ing ärch. An arch formed in the substance of a wall to

Discharging Arch.

relieve the part which is below it from the superincumbent weight, commonly used over lintels and flat-headed openings.

Discipline, 'i-plin. Education; instruction; training. Rule of government. Subjection to rule. Correction; punishment inflicted by way of correction and training; instruction by means of misfortune and the like. In the R. C. Ch. bodily punishment inflicted on a delinquent; or that external mortification which a pen-

itent inflicts on himself. The scourge a delinquent uses in self-chastisement; or that wielded by his confessor. Books of discipline, two books drawn up for the reformation of the Scotch Church—the first by Knox and four other ministers in 1560, the second by a committee of Assembly of 1578, in which Andrew Melville took a leading part. This is still appealed to as the most complete and authoritative exhibition of Scottish Presbyterianism.

Dischidia, -kid'i-a. A gen. of Asclepiadaceæ, herbs or under shrubs. One species, *D. Rafflesiana*, is remarkable for its numerous pitcher-like appendages.

Disciples of Christ (Campbellites). An independent sect holding views substantially identical with the Baptists, founded in the U. S., 1809, by Rev. Thomas Campbell, a distinguished preacher of the Presbyterian church, from which he seceded, and his son, Rev. Alexander Campbell, both natives of Ireland. The sect numbers nearly three-quarters of a million communicants, most of them being in the S. and W. States.

Discobolus, -kob'o-lus. In Class. Antiq. a thrower of the discus or quoit; a quoit-player. The name given by Cuvier to his 3d family of soft-finned teleostean fishes. The lumpfish (*Cyclopterus Lumpus*) is a good example of the group.

Discobolus throwing the Discus.

Discophora, -kof'o-ra. A sub-class of the Hydrozoa, comprising most of the organisms known as sea-jellies, jelly-fishes or sea-nettles. A name sometimes given to the order of annelids, Hirudinea, to which the leech belongs.

Friction-balls, -balz. Balls placed under a heavy object to reduce the friction, while that object is moving horizontally. Some swing-bridges have, such balls placed under them.

Friction-clutch, -kluch. A species of loose coupling much used for connecting machines which require to be frequently engaged and disengaged, or which are subject to sudden variations of resistance.

Friction-cones, -konz. In Mach. a form of slip-coupling, which allows the cones to slip on any extreme pressure being applied.

Friction-coupling, -kup'ling. A form of coupling in which two shafts are connected by friction, as in the friction-clutch and friction-cones.

Friction-powder, -pon-der. A composition of chlorate of potash and antimony, which readily ignites by friction.

Friday, fri'dä. The 6th day of the week. Good F., the Friday immediately preceding Easter; which is kept sacred, in memory of the sufferings and death of Christ, as it is believed to be the anniversary of the day on which he was crucified.

Friedland, fräd'lahnt. A town of E. Prussia, 86 m. S. E. of Königsberg, noted for the great victory, June 14, 1807, of the French under Napoleon I. over the allied Russian and Prussian armies, resulting in the treaty of Tilsit.

Friendly Islands (Tonga). An archipelago of the S. Pacific, of which Tongataboo is the chief island; pop. abt. 25,000.

Friend, frend. One of the Society of Dissenters, which took its rise in England about the middle of the 17th century, through the preaching of George Fox.

Frieze, frîz. In Arch. that part of the entablature of a column which is between the architrave and cornice. It is a flat member or face, usually sculptured. A coarse woollen cloth having a shaggy nap on one side, extensively manufactured in Ireland.

Frieze.

Frieze-panel, 'pan-el. One of the upper panels of a door of six panels.

Friga, frig'a. In Scand. Myth. the wife

of Odin, a goddess corresponding in some respects to the Aphrodite of the Greeks and Venus of the Romans. Called also Freya.

Frigate, frig'at. A war vessel larger than a sloop or brig, and less than a ship of the line; usually carrying thirty to sixty guns on the main deck and on a raised quarter-deck and fore-castle, or having two decks. Since the introduction of iron-clad war vessels the term has been applied to those having a high speed and great fighting power. Double-banked frigates, such as carried guns on two decks and had a flush upper-deck. Steam frigates, large steamships carrying guns on a flush upper-deck, and having a tier also on the lower deck.

Frigate.

Frigate-bird, -berd. The name given to a gen. of tropical birds (Tachypterus), pelican fam. (Pelicanidae), and allied to the cormorants; a man-of-war bird.

Frigate-bird.

Frigid Zone, frîj'id. A space about either pole of the earth, terminated by a parallel of 66½° of latitude, known as the polar circles. At the pole the sun is visible for half the year and invisible the other half.

Frimaire, frê-mär. The 3d month of the French republican calendar, dating from September 22, 1792. It commenced November 21, and ended December 20.

Fringe, frinj. An ornamental appendage to the borders of garments or furniture, consisting of loose threads. The use of fringes is of very great antiquity, as shown by the dresses of figures on the ancient

Assyrian Fringes.

A Remarkable Storehouse, and Work of Reference, for Almost Every Department of Human Knowledge.

This is an entirely new book, compiled by competent Editors, in consultation with the best authorities. It contains over 700 pages, and is printed from entirely new plates, and the type is large and clear. This Cyclopædia is a **Treasury of Knowledge**, and will be found of the greatest use in answering the ten thousand questions that constantly arise, in regard to dates, places, persons, incidents, statistics, etc., etc.

What the Cyclopædia Contains.

The various Arts, Trades, and Sciences, of necessity make use of technical terms, and these are so little used outside of those special branches, that ordinary Dictionaries omit a large share of them. Among the technical terms explained will be found those belonging to

Agriculture. **Astronomy.**
Architecture. **Botany.**
Chemistry. **Engineering.**
Geography. **Geology.**
Horticulture. **Mechanics.**
Medicine. **Physiology.**
Natural History. **Mythology.**
And Numerous Other Arts and Sciences.

Among other topics upon which it is very full are: **Biography**, including eminent living persons. **History**, **Literature**, and others, in nearly all the various Departments of **Human Knowledge**.

Over 1000 Engravings. On account of the size of the pages, the engravings are necessarily small, but they are wonderfully clear, and selected with a view to illustrating the subject rather than to make a show.

When we consider the vast number of topics, the judgment exercised in their selection, the conciseness with which they are treated, and the copiousness with which they are illustrated, **The American Agriculturist Family Cyclopædia** is a remarkable book.

Every one who reads, should, when he meets with a word that is new to him, or one the meaning of which he does not understand, at once look up the word in a dictionary or elsewhere. But the definitions of the dictionary, in many cases are found to be meagre, and the meaning must be sought in some more comprehensive work of reference. Comparatively few can afford to possess one of the standard Cyclopædias, in many volumes.

Consequently the publishers of the *American Agriculturist* have been on the lookout for some volume sup-

plementing the Dictionary, some **multum in parvo**, which they might present to all of their readers, old and new. They now have it in this entirely new Cyclopædia, which will be ready for delivery in a few days.

PRESENT EXTRAORDINARY.

To every Subscriber (new or old), to the *American Agriculturist* for 1885, at \$1.50, whose subscription is received before December 1st., we will present this Cyclopædia at our office.

Or we will mail it to any subscriber in the United States or Provinces, on receipt of 15 cents additional for packing and postage, making \$1.65 in all.

A Famous Biographical and Historical Work.

LIVES OF OUR PRESIDENTS!

There is no class of men the events of whose lives are so interesting to American citizens as those who have been elevated to the highest office in the gift of the people. This book contains the life of every man who has occupied the Presidential chair, from George Washington to the present incumbent. The biographies are not brief sketches or outlines, but are full, complete and exhaustive, narrating every prominent event in the life of each President, from the incidents of his boyhood down to his death, or to the present period, together with extracts from his most important speeches and public documents. Incidental to the biographies, we have almost a complete history of our country, from the time of the struggle for Independence to the present day, for no class of men have been more closely identified with our national growth than have our chosen rulers, and each Administration has formed a distinct era in American history. Thus, in the life of Washington we have a full account of the military operations during the Revolutionary War, while in the lives of John Adams and Thomas Jefferson we are made fully acquainted with the diplomatic and legislative details of that great struggle. In the lives of James Madison and Andrew Jackson we find a history of the War of 1812, in that of Harrison the exciting incidents of the Wars with the Indians, while in those of Taylor and Pierce a full history of the Mexican War is given. Coming down to the late struggle for the Union, we find in the life of Abraham Lincoln a complete narrative of the political features of the contest, and in that of General Grant an account of the more important military operations. Thus are history and biography blended in this book, and the result is a work of the most interesting and instructive character. No person who would be familiar with the history of his country and the lives of its chosen rulers (and no American citizen can claim to be well informed without such knowledge), can afford to be without this book, and every father should buy it for the instruction of his children. It is written in such an entertaining manner that young people will read it as readily as a novel, from which no useful information is gained. The lives of George Washington and Abraham Lincoln contained in this volume are alone worth the price of the book. "LIVES OF OUR PRESIDENTS" is a large book of more than 400 pages, square 12mo, handsomely printed from large type upon fine paper, and elegantly bound in cloth, embellished with artistic designs in gold and black. It contains a full page portrait, reproduced from a steel plate, of each of the Presidents, with a fac-simile of his autograph, together with many other beautiful and interesting illustrations, such as the birthplaces and early homes of the Presidents, historical scenes and incidents, public buildings, etc. It is a book which would grace any library or parlor table; it is a book which will be read with both pleasure and profit, and may be handed down in a household from generation to generation, for it is a narrative of facts and not of fiction, and will be just as interesting and instructive to your children's children as it is to yourself. "LIVES OF OUR PRESIDENTS" will be sent by mail, post-paid, to any address upon receipt of price, only **One Dollar**. It is the cheapest book of the kind ever issued, no work of its scope and character ever having been published heretofore for twice that sum.

as they are wanted, and will **Present** a bound volume, post-paid, for every 4 renewals at \$1.50 each; OR, for 3

new subscriptions at \$1.50 each. Price per bound volume \$2.00, or \$2.30 if sent by mail.

The above is the description of the publishers. We will send this book (just published), postage pre-paid, to any subscriber who will forward us a new subscription at \$1.50 for 1885, and 10 cents additional for packing and postage, making \$1.60; OR, we will send it, post-paid, for the price to any address.

No. A.—Family Bible.—Price \$12.00.—This handsome Bible is especially appropriate as a Christmas or Wedding present, and worthy of being preserved as an heirloom. It comprises the Old and New Testaments, and the Apocrypha; 2,000 Illustrations, including 30 full-page steel-line and other fine Engravings, Presentation Plate, beautiful colored Maps, handsome Marriage Certificate, several pages for the Family Record, Jewish and Egyptian Antiquities illustrated, the Lord's Prayer and Ten Commandments illuminated, a Concordance, many valuable Chronological and other tables, and helps to Bible study. The book is bound in best German Morocco, with new raised panels, full gilt sides and back, gilt-edged leaves, and extra heavy nickel plated clasps. It contains 1,700 pages, printed in large, clear type; in fact the description and accompanying engraving

beautifully illustrated. Supplied for price; OR, **Presented** for 11 subscriptions at \$1.50 each. Receiver to pay freight, which is small, for either of these Bibles.

No. C.—Unabridged Dictionary.—Price \$10.00.—Next to the Bible, the most desirable book in every household is the Dictionary, and we offer our friends the opportunity of securing an excellent one.

Worcester's Great Illustrated Quarto (revised edition), will prove a valuable friend to every member of the family, giving the spelling, pronunciation, definition, and full explanation of more than 100,000 words; thus being nearly equal to an Encyclopedia. It contains 1,854 three-column pages, and numberless engravings, is strongly bound in leather, weighs 12 pounds, and is a recognized authority. This book is an actual **Instructor**; and it can be obtained by anyone sending us 12 subscriptions at \$1.50 each; OR, we will supply it for the price, express prepaid, or by post to any place in the United States or Territories, if 96 cents be sent us to prepay.

No. D.—Abridged Dictionary.—Price \$1.00.—Any one who is not yet able to procure the large Dictionary, will do well to get the "Webster's Abridged," which contains 18,000 of the most important and most frequently sought words, with their meanings, and 200 illustrations. This will be **Presented** for 2 subscriptions at \$1.50 each; OR, supplied, post-paid, for \$1.00.

No. E.—Twelve Good Books in One.—An annual volume of the *American Agriculturist* contains about 1,000 sketches and engravings, relating to almost every phase and detail of rural life, in-doors and out. A complete Index affords quick reference to any subject, and the volume is neatly bound in black cloth, with gilt title, etc. A set of these volumes would form a valuable and comprehensive library, giving reliable advice and information on all Farming, Gardening, and Household matters, the articles being written by the most experienced and practical men and women. Each of these volumes contains, in its reading columns alone, as much matter as twelve ordinary books sold at \$1.50 (\$18.00). We preserve the electrotype plates, and print new copies

give but a slight idea of the beauty, completeness, and value of the work. We **Present** this Bible for 13 subscribers at \$1.50 each; OR, supply it for price.

No. B.—Bible.—Price \$10.00.—Another handsome book, smaller than the above, but very elegantly bound in French Morocco, with new raised panels, full gilt sides and back, and gilt edges. Contains over 1,400 pages, and has 1,500 engravings, of which 26 are full page, by Gustave Doré, and four superb engravings in colors, descriptive of the Tabernacle, Jewish Worship, etc.; and illustrated History of the Books of the Bible with tables, Bible History, etc.; and the cities of the Bible

Microscopes.

We think we may justly claim that the *American Agriculturist* has done more to popularize the use of the Microscope among all classes in this country, than any other agency. Several years since, we caused to be manufactured exclusively for the subscribers of the *American Agriculturist*, by the very first makers in this country, a small microscope which proved to be of great value and popularity. Nearly forty thousand of these Simple Microscopes were asked for by our subscribers, and at one time in the year the call for them was so great, that we were unable to fill the orders. Subsequently, the same makers manufactured for us a valuable Compound Microscope, of which large numbers are being sent to our subscribers all over the world.

Last year we opened negotiations with these makers for some Simple Microscope, which should surpass the previous one, or any other instrument made in either hemisphere. After many months of experiment and trial, these manufacturers brought out the desired instrument fully described on page 456. This is not only superior to anything of the kind ever made, but is furnished at a lower figure than any other genuine microscope. It has none of the mechanism and features of the cheap, spurious microscopes which are now being palmed off at "low figures" on the public.

Suggestions for Securing Subscribers.

Prepare for yourself a list of your friends and neighbors who do not take the *American Agriculturist*, or who, having once taken it, have neglected in past years to renew their subscriptions. Show them copies of the *American Agriculturist* with its wonderful improvements of to-day. Point out to them the great variety and cheapness of the paper, especially directing their attention to the great number of beautiful illustrations. Probably there is not a farmer or householder in the world who has not heard of the *American Agriculturist*.

If you give them opportunity to examine it, you will experience little difficulty in securing your friends and neighbors as subscribers for 1885.

As soon as you commence to work for a premium forward us the names of such people in your neighborhood as are pretty sure to join your club if they can see copies of the paper, and we will immediately forward specimen copies to these names free and post-paid. We have never made this offer before, but have always charged for sample copies except in special cases. Now we make this special offer to every person who begins the work of raising a club. That is to say, we will, in order to help you to secure your premiums, send the specimen numbers as you may direct to such persons as you think may become subscribers.

VALUABLE * ARTICLES * FOR THE * HOUSEHOLD.

SILVER-PLATED WARE.

LATEST [1885] PATTERNS.

No. 1. — Cat or Dog Napkin Ring. — Price \$1.50. — A novel and amusing design for a Napkin Ring, being the head and limbs of a solemn little Pug-dog, with the ring in place of his body. Prettily chased and ornamented. Another ring has the head and limbs of a demure-faced Cat instead of those of a dog. These rings are especially acceptable to children, and either one of them will be **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for \$1.50. Post-paid in either case.

No. 2. — Napkin Ring. — Price 75 cts. — A remarkably fine Ring for the price, being one and three-quarter inches wide, and of the best quadruple plate. The chasing is very elegant, and of a new design, a spirited boating scene. This ring will be **Presented** for 1 subscription at \$1.50; OR, supplied for price. Post-paid in either case.

No. 3. — Butter Dish. — Price \$5.50. — An excellent article in every respect, prettily chased and ornamented. Provided with a perforated drainer for the

melting ice, a dome-shaped cover bearing a shield, on which an initial or monogram can be engraved, and a pair of rests for the butter knife. This last will be found a great convenience in saving the table linen from greasy spots. **Presented** for 6 subscriptions at \$1.50 each; OR, supplied for price. Recipient to pay small expressage in either case. (See below.)

No. 4. — Fruit Dish. — Price \$9.00. — A very elaborate center-piece for a dinner table, consisting of an ornamental glass dish, supported by a massive stand of best quadruple silver plate. A charming little figure in Kate Greenaway costume, and surrounded by cupids and a wreath of roses, peeps out from beneath the stand. This dish would be a handsome present for a friend. Stands nine inches high, and when filled with large fruit is very imposing and elegant. **Presented** for 10 subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay small expressage. (See below.)

No. 5. — Dinner Caster. — Price \$7.00. — This handsome Caster will give an air of elegance to the dinner table. It is of best quadruple plate, elaborately chased in flower and butterfly pattern shown in the engraving, and contains five shapely glass bottles, three of them with silver stoppers. It has the "Patent Non-friction Bearing," by means of which it revolves smoothly, producing no jarring of the bottles, nor noise. **Presented** for 7 subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay small expressage.

No. 6. — Breakfast Caster. — Price \$6.00. — Simple but elegant design. Each of the four cut-glass

bottles rests in a silver cup, and is encircled by a wreath-pattern; two of the cruetts have silver tops, and two, cut-glass stoppers. This caster is of the best plate, is easily cleaned, and of the most appropriate size for the breakfast table. **Presented** for 6 subscriptions at \$1.50 each; OR, supplied for price. Small express charges to be paid by receiver. (See below.)

No. 7. — Sugar Basin. — Price \$6.00. — This Sugar Basin has the satin finish, which is superior to others in not scratching easily. It is of a substantial looking shape, with a cover and an ornamental shield for the owner's name or monogram. It will be **Presented** for 6 subscriptions at \$1.50 each; OR, supplied for the price. Receiver to pay small expressage.

No. 8. — Cream Jug. — Price \$5.50. — This Jug is of the same workmanship and design as the preceding sugar basin, and the two together will make a pretty pair, though either one alone will be both ornamental and serviceable on a tea table. The Jug will be **Presented** for 6 subscriptions at \$1.50 each; OR, supplied for price. Expressage to be paid by the receiver.

No. 9.—Card Receiver.—Price \$7.50.—Best quality of quadruple plate, with the peculiar and exquisite finish in mingled gold and silver, known as Niello work. This Card-receiver is of unique design, as shown in the engraving, with dainty sprays of field flowers worked out on the plate. Very ornamental on a center-table, and can be used for holding visiting cards, photographs, Xmas cards, etc. Its height is six inches. **Presented** for 3 subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay small expressage. (See below.)

No. 10.—Iced Water Pitcher.—Price \$12.00.—This magnificent Pitcher is thirteen inches high, double-walled, and very elaborately ornamented; with satin finish, which is particularly durable, and does not show scratches. A space in front is intended to bear a name, monogram, or initial, as preferred. Made of fine, quadruple plate. **Presented** for 12 subscriptions at \$1.50 each; OR, supplied for the price. The recipient to pay expressage, which is small, in either case. (See below.)

No. 11.—Cake Basket.—Price \$8.00.—This magnificent Basket stands fourteen inches high, and bears the stamp "quadruple-plate." The interior decoration is exceedingly elaborate, and the finish of the handle particularly graceful, as will be seen in the en-

graving. The shape of the whole basket is the most popular one in the New York market. **Presented** for 9 subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay expense of carriage in either case. *

Table-Spoons, Tea-Spoons, and Forks.

These goods are both substantial and elegant, being ornamented with artistic designs, and manufactured of thoroughly reliable material. They are plated with full weight of pure silver on the finest spring-tempered nickel silver—the "A 1 Standard Plate" of the Wilcox Silver Plate Company, whose stamp is on the back of each article. The decoration of the Handle is a delicate flower-spray, with designs of elegant and fashionable style. The forks are medium size, which will be found the most convenient, answering every ordinary purpose.

No. 12.—One Dozen Table-spoons.—(Design and quality given above), will be **Presented**

for 10 subscriptions at \$1.50 each; OR, furnished for \$9.50, post-paid in either case.

No. 13.—One Dozen Tea-spoons.—Price \$4.75.—Of the same quality and design as preceding, will be **Presented**, post-paid, for 5 subscriptions at \$1.50 each; OR, supplied for the price, post-paid.

No. 14.—One Dozen Forks.—Price \$9.50.—To match the spoons, and of medium size, will be **Presented** for 10 subscriptions at \$1.50 each; OR, supplied for the price, post-paid.

No. 15.—A Dozen Plated Knives.—Price \$5.50.—Guaranteed to be triple plated on steel, and thoroughly reliable; with the fashionable pointed "Windsor" handles. They can be used for either meat or dessert, as they are of medium size, and requiring to be only washed after use, are much less trouble to keep clean than steel knives, besides being very ornamental on the table. They will be **Presented** for 6 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

No. 16.—Ice Cream Spoon.—Price \$3.50.—This is of the finest quality silver plate, and the engraving shows the elegant and elaborate designs on both the bowl and handle of the spoon. It can be used in serving ice cream, pie, jelly, and many other dishes, and is very ornamental on a table. This hand-

some article will be **Presented** for 4 new subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

No. 17.—Sugar Shell.—Price 75 cents.—A pretty and inexpensive little spoon for sugar, with the bowl fluted in imitation of a scallop-shell, and the slender handle decorated in Eastlake design with ferns. Of good quality silver plate. **Presented** for 1 subscription at \$1.50; OR, supplied for price, and sent post-paid in either case.

No. 18.—Silver and Gilt Drinking Cup.—Price \$3.00.—It is of "Niello" finish, with gilt lining, and prettily decorated with tiny "Marguerites," or field daisies. The handle is a twisted serpent of delicate workmanship, and on the front of the cup is an open space, where the owner's name is to be engraved among the daisies. This beautiful cup will be **Presented**, post-paid, for 4 subscriptions at \$1.50 each; OR, sent, post free, for the price.

No. 19.—Child's Set.—Price \$3.50.—A Knife, Fork, and Spoon, of rather small size, and made of the best quality silver plate. They are prettily decorated, and fitted firmly into a strong case of black morocco,

with rose-colored satin lining, and brass finish. A very complete set, and suitable for a christening or birthday present. We will send the whole set in case for 4 new subscriptions at \$1.50 each; OR, supply it for price. Post-paid in either case.

No. 20.—Pickle Caster.—Price \$4.25.—An ornamented cut-glass jar, on a stand nearly twelve inches high, made of best quadruple plate, on hard, white metal. The cover of the jar is also silver-plated, and has a raised flower pattern on each side; a pair of tongs, which terminate in two shapely hands, hang from the sides of the stand. A most complete and elegant looking caster for pickles, olives, etc. It will be **Presented** for 5 subscriptions at \$1.50 each; OR, supplied for the price. Small Expressage to be paid by the receiver. (See below.)

No. 21.—Nickel-Plated Nut Picks and Cracker.—Price \$2.25.—A strong, handsome case, containing half a dozen nut-picks and a nut-cracker, made entirely of steel, heavily nickel-plated, and handsomely chased. Sent post-paid for 3 subscriptions at \$1.50 each; OR, supplied for the price.

The American Agriculturist
Simple Microscope, devised and
manufactured expressly for us,
can be obtained only through us.

NOW

REVEALED

TO ALL

OUR SUBSCRIBERS

BY THE

Fig. 1.—Microscope Closed.

Fig. 2.—Microscope Ready for Use.

American Agriculturist New Simple Microscope,

Pronounced by experts, by the highest scientific authorities in such matters, to be the most complete, most perfect, most useful, and the cheapest instrument of the kind ever devised in this or any other country.

Dr. GEORGE R. CUTTER, Translator and Editor of Prof. Heinrich Frey's great work on the "Microscope and Microscopical Technology" and "Compendium of Histology," Author of the Dictionary of German Medical Terms, Surgeon to the N. Y. Eye and Ear Infirmary, etc., etc., and one of the recognized living authorities on the Microscope, writes us as follows:

52 Bedford Ave., Brooklyn, N. Y., August 19, 1884.

"I am very much pleased with your NEW AMERICAN AGRICULTURIST MICROSCOPE. I find the lenses very clear and well centred. On combining the three lenses with the diaphragm, I get a clear, well-defined, highly magnified image. The stand, mirror, stage, and arrangement for adjusting the lenses are capital; and both the defining and resolving powers of the combination ARE VERY GREAT. I have used this Microscope for dissecting and preparing specimens, and find it equal to some imported ones costing from fifty to seventy-five francs (that is, from \$10 to \$15 in Paris). For examining certain specimens, and for many purposes, it is SUPERIOR to MANY COMPOUND MICROSCOPES COSTING SEVERAL TIMES THAT SUM. I think the excellence of the instrument, the surprisingly low price at which it is sold, and the very judicious directions for its use which accompany the instrument, are destined to largely add to the microscopical talent of the country, by increasing the number of amateur microscopists."

Respectfully,

GEORGE R. CUTTER, M.D.

By means of the telescope we discover unknown worlds; but there is an invisible world around us, full of objects hidden from our eyes by their minuteness, which, by the aid of a microscope, we can discover and study with great pleasure and profit to ourselves. There are animal forms so infinitesimal that millions of them move, feed, and multiply, and apparently enjoy themselves in a space as small as a five cent piece.

Not only are there minute forms of animal life, but there are innumerable plants so small that no one is aware of their existence until it is revealed by the Microscope. These Little Things are not only interesting, but to see and know them is of

Great Importance to Us.

The greatest harm to our Crops, our Animals, our Fruits, our Flowers, even to our bodies, is found to be

Fig. 3.—Mirror.

due to living things, both vegetable and animal, so small that they have until recently escaped our knowledge.

Do You Want to See some of these small but wonderfully interesting things? We are now prepared to help every reader of the *American Agriculturist* to

some conception of them, to help look a little way down into this unseen world.

The American Agriculturist Compound Microscope, planned, devised, and made expressly

Fig. 4.—Spring Clips.

for the readers of this paper by the renowned Bausch & Lomb Optical Co., enables you to examine, and to see very distinctly and clearly, a vast multitude of interesting things, each one a thousand times smaller than the thinnest thing that you can see with the unassisted eyes. This instrument, as you will learn from the description, is accessible to all our readers, either without cost, or at a cost far below anything like it was ever before offered—at a cost so small that if you knew how valuable it is, you would spare no effort to get it immediately.

Not a Family, not a Teacher, not a School, should be without one. Every farmer in the land should have one. It would be of more interest to all, and to most people more useful, than anything else they could buy for many times the cost.

By special arrangement to have them manufactured on a large scale, with automatic machinery, (which not only secures entire uniformity in quality and a perfection far beyond former methods, but reduces the cost to a small fraction of the former hand manufacture), these most

useful instruments are now brought within the easy reach of every man, woman, and child.

DESCRIPTION.—The *American Agriculturist* NEW Simple Microscope is shown in fig. 1, ready for packing in its box, while fig. 2 shows the lenses raised and ready for use. The stand or body is of nickel-plated metal (resembling silver and untarnishable). It stands upon a broad bottom. An opening on one side admits light within to a

Circular Mirror, fig. 3; this concentrates and throws the light up to the object examined. This Mirror is so suspended that it can be turned to any angle required by the incoming light from a window, or from a lamp at night. This Mirror is of great importance, and is one of the very decided improvements upon the former Simple Microscope supplied seven years

Fig. 5.—Lenses on Standard.

ago to our readers. By its aid the needed extra illumination of the object to be examined is provided. At the top of the stand is a Glass Stage set in a frame like a watch crystal.—Two nickel-plated Spring Clips,

fig. 4, over this stage, hold firmly upon it the slides that carry the objects to be examined.—The Microscope is also accompanied by **two Glass Plates** or slides,

Fig. 6.—LENSES AND DIAPHRAGM, SEPARATE.

and also, to be placed between them, a waterproof **Cell** for holding seeds, insects, and other small objects and fluids. **The Lenses**, figs. 5 and 6, are of course the most important thing in any microscope. In this instrument there are **THREE** of them, of different powers, and so arranged that one can be used where low power is required; a second one for a little higher power, and

a third for a still higher power. Then again any two can be combined for other powers, and all three when the highest power of the instrument is desired. Thus **seven** different powers can be quickly provided, ranging from a magnifying power of seven diameters up to twenty-five or more. (It will be understood that if a lens magnifies twenty diameters, that is twenty times in one direction, it magnifies equally in all directions or twenty times twenty areas, or four hundred times (less what is taken off from the corners, in cutting a circle out of a square). A circular area of twenty-five diameters is nearly five hundred times that of one diameter, and this (500) is the magnifying power of these three lenses used together.) They are of highest quality glass, and ground to perfection, of course by automatic machinery so that there can be no variation of curvature. They are as free as possible in an instrument of this kind from the imperfections of ordinary lenses, in fact nearly achromatic, a point not even attempted in the great mass of cheap microscopes sold at moderate prices.—A **Diaphragm** (shown at the lower left-hand of fig. 6, and in fig. 5) is provided to cut off outside light in examining minute objects, and concentrate the vision upon a single point. This turns in or out as needed.—All the Lenses are attached (as in fig. 5) to a **Sliding Rod Standard**, fig. 7, which is moved up and down in a tube by the thumb-piece, making it thus easy to adjust the lenses to any desired distance from the object, in order to find the proper focus, and to suit them to different eyes.

The whole apparatus is packed in a neat and remarkably strong **Box**, adapted to hold it for carrying safely by any conveyance, and for keeping it when not in use.

We can conceive of no more convenient arrangement of all the parts for practical use, than are most effectively combined in this remarkable Simple Microscope.

HOW SUPPLIED.

This Simple Microscope is more valuable in the quality of its lenses, its arrangements, etc., than any thing we have seen offered for several dollars. Probably its equal can nowhere else be had under four or five dollars. But it will be supplied by us and sent *delivered free* to any part of the United States and Territories for two dollars, and *delivered free* to any actual subscriber to the *American Agriculturist* for 1885, for **One Dollar and twenty-five cents**.

FURTHER.—We will present one, delivered free, and send the *American Agriculturist* to a new subscriber, post-paid, during all of 1885, for two dollars.

FURTHER.—We will present this Microscope to any present subscriber, and **deliver it free** to him, who will send us two new subscribers to the *American Agriculturist* for one year, at one dollar and fifty cents each.

Take Notice ALL Subscribers.

Any person already a subscriber to the *American Agriculturist*, can have one of the above Microscopes delivered free to him for one dollar and twenty-five cents.

A Wonderful Microscope.—High Excellence with Low Cost.

A Treasure for every Family, allowing Old and Young to view the wonders that lie unseen all around them, affording an endless source of amusement and instruction, at a cost within the reach of all.—A great boon to the student—a substantial, convenient, useful and powerful working instrument, at no greater price than is charged for useless Toy Microscopes. Schools everywhere can now possess that valuable educational aid, a good Microscope. A great help to Farmers, Physicians, Tradesmen and others, at a heretofore unknown low cost. An equally serviceable instrument formerly cost four times as much!

Partial Description.—(A full Description, also Prof. Phinn's "Book on the Microscope" go with each Instrument).—**A**, Heavy jet-black iron foot. **B**, Two iron pillars, with irons between, allowing the instrument to turn to any angle from perpendicular to horizontal.—**D**, is a metal stage, with spring clamps, which are easily adjusted to thick or thin plates, or quickly removed.—**E**, Revolving diaphragm, with different sized apertures to graduate amount of light admitted.—**F**, **F**, concave mirror, throwing light up from below through transparent objects; or turned above to throw light upon opaque objects.—**G**, The body, nickel-plated, which is moved up and down with great delicacy of adjustment of focus, by the rack and pinion, moved by the milled heads (one seen at **H**).—**I**, Two object glasses, used separately or together, according to power desired. These, the most important part of any Microscope, are of very superior quality.—**L**, is a nickel-plated draw-tube, $3\frac{1}{4}$ inches long, adding materially to the length of the body when higher magnifying power is desired.—**K** (shown in section at the left, in fig. 2), is a very complete eye-piece, having all the parts of the most costly Microscope, viz., field glass, **Q**; diaphragm of black metal, **P**; eye-glass, **O**.—All parts of the eye-piece are mounted in frames with removable screws.—**Fig. 3.**—The **Camera Lucida** is a new and most valuable appliance for throwing the image of any object, magnified to any desired size, upon paper in a way to be easily sketched with a pencil by any person, or by a child, if old enough to trace lines and marks with a pencil.—**With this, one can make a complete picture, 3 or 4 inches across, of the foot of a fly, the parts of a plant, and of many other things so small as to be almost invisible to the unaided eye.**

Fig. 2.—EYE-PIECE.

Fig. 3.—CAMERA LUCIDA IN USE.

The structure of plants and insects may be studied, and the invisible beauty of multitudes of objects may afford amusement and instruction to young and old. But the Microscope, besides revealing hidden wonders, and affording interesting occupation in the home circle, plays an important part in practical matters. The fibres of cotton, linen, and silk each presents a characteristic appearance under the Microscope, which allows them to be readily distinguished, and any fraudulent substitution of one for another in a fabric, may be at once detected. Diseased meats, especially pork containing trichines, are dangerous to health and life; their character may be at once ascertained by the Microscope. The adulterations now so common in various articles of food and medicine, are instantly revealed by the Microscope. Among other uses is the valuable aid it gives to physicians in determining the character of diseases, and the presence of their germs.

Price \$15 (or \$10 to *American Agriculturist* subscribers, for whom it was specially designed).—This price includes the **Camera Lucida**, the Walnut Case (fig. 4) packed in an exterior box, so that it will go safely anywhere by express; also a free copy of Prof. Phinn's Book on the Microscope, some glasses, etc.—Carriage paid by recipients.

The whole will also be **Presented** to any one furnishing 10 subscriptions to the *American Agriculturist* at \$1.50 a year each. The Teachers or Pupils in every school not already supplied should at once make up a subscription club, and secure this Microscope for the benefit of all. Plenty of people would take the paper for their own use, when by so doing they would help so valuable an enterprise.

N. B.—Any one desiring the above Microscope for immediate use, or as a present, can forward \$10 and receive it, and deduct the \$10 from the subscription money if he afterwards makes up a Premium Club for it, as above offered.

The New American Agriculturist COMPOUND MICROSCOPE.

This instrument is not only made expressly for the subscribers to the *American Agriculturist*, but was in part invented for them by the Optical Company who made the Simple Microscope. The many different parts are all made by accurate machinery, and are interchangeable. The lenses, or glasses, the most important part of the instrument, instead of the former difficult and uncertain hand work, are now ground and shaped by automatic machinery, which secures perfection and precision. It is no mere scientific toy, but is designed for work. It is provided with a **Camera Lucida**, a wonderfully simple and effective device to enable one to draw what is seen. The manner of using the Camera Lucida is illustrated above in figure 3. By the aid of this Microscope a vast number of objects invisible to the unaided eye, may be seen and examined.

Fig. 4. Microscope condensed in Walnut Case ($8\frac{1}{2} \times 4\frac{1}{2} \times 3\frac{1}{2}$ inches), in which it is firmly held for carrying or keeping.

Fig. 4. Microscope condensed in Walnut Case ($8\frac{1}{2} \times 4\frac{1}{2} \times 3\frac{1}{2}$ inches), in which it is firmly held for carrying or keeping.

OPTICAL INSTRUMENTS, ETC.

Nos. 22 and 23.—Opera Glasses.—Useful in all large assemblies, concerts, etc., as they afford a close view of speakers, singers, or the audience, also for making out the details of lofty buildings and

paintings in galleries. Opera Glasses are in fact short range telescopes, to be used by both eyes at once. We offer two:

No. 22, is a beautiful glass for a lady, made of either white or Oriental pearl—**Presented**, post-paid, for **17** subscriptions at \$1.50 each; OR, supplied, post-paid, for \$16.00.

No. 23, is covered in black morocco, with japanned tops, branches and slides. It has a seventeen-line object-lens, and fits into a good leather case. Of excellent manufacture, and desirable for either a gentleman or a lady. We **Present** this glass, post-paid, for **7** subscriptions at \$1.50 each; OR, supply it, post-paid, for \$6.00.

No. 24.—Field or Marine Glass.—Price \$16.00.—A large and very powerful pair of glasses, manufactured by one of the best makers, covered in morocco, and with black japanned sides. It is provided with movable sun-shades, one of which is shown extended in the engraving, and fits into a neat case with

shoulder-strap. Many persons prefer this glass to a telescope, as it allows the use of both eyes, and it will be found convenient either in travelling or for over-seeing men at work in different parts of a field, etc. We will **Present** one of these handsome glasses, post-paid, to any one sending us **17** subscriptions at \$1.50 each; OR, supply it for price, post-paid.

No. 25.—Tourist's Telescope.—Price \$16.00.—This is a very powerful instrument, and will be found a most delightful companion to any one making

tours, whether on foot or by boat. It is provided with a sun-shade, and a convenient case with strong leather straps, so that it can be slung across the shoulders, and carried easily, thus being particularly adapted to mountain climbing. We will **Present** the Telescope for **16** subscriptions at \$1.50 each; OR, supply it for the price. Sending it pre-paid in either case.

No. 26. "Achromatic" Telescope.—Price \$3.75.—This Telescope will give a distinct view of a house 8 or 10 miles distant. It measures 16½ inches when extended, and has a brass body covered with morocco. An "Achromatic" Telescope is one so constructed that the colors are not produced which sometimes mar the view in an ordinary glass. When not in use, this Telescope collapses to a size convenient for carrying. We **Present** it, post-paid, for **5** subscriptions at \$1.50 each; OR, supply it for price, post-paid.

No. 26.

No. 27.

No. 27.—Thermometer.—Price \$1.25.—Every one should have at least two Thermometers, so as to be able to compare the temperature of the house with that outside, and now that these articles are sold so cheap, it would be very easy, and always beneficial to have one in each room as a guide in the heating, etc. The one we offer is strong and neat looking, and sufficiently accurate for ordinary household use. We **Present** it, post-paid, for **2** subscriptions at \$1.50; OR, supply it for price, post-paid.

No. 28 and 29.—Two Useful Glasses.—The Reading Glass, **No. 28**, is very convenient, having a handle, and being a slight magnifier—the lens measures 3¼ inches in diameter, and will be found of great assistance to persons having weak eyesight, or to any one looking at engravings, etc. It will be **Presented** for **2** subscriptions at \$1.50 each; OR, supplied for \$1.50, post-paid.

No. 29, is of higher magnifying power than the preceding, and is intended for carrying in the pocket, having a case of hard rubber attached. Convenient for examining insects, flowers, or any small objects, or can be used as a sun-glass. The engraving is less than half the size of glass, the lens measuring 1¼ inches in diameter. **Presented** for **2** subscribers at \$1.50 each; OR, supplied for \$1.20, post-paid in either case.

No. 30.—Pocket Compass.—Price \$2.00.—This Compass is mounted in a strong, brass case, with a secure cover, provided with a "stop," by which the needle can be lifted from the point when not in use. A Compass is always desirable, and particularly satisfactory to a person away from home, as one is often apt to "lose his bearings" when in a strange place. **Presented**, post-paid, for **3** subscriptions at \$1.50 each; OR, supplied, post-paid, for price.

No. 31.—Graphoscope and Stereoscope Combined.—Price \$6.00.—This glass is intended to be used in looking at pictures of all kinds, and is a good magnifier. The pleasure derived from the pictures is incalculably increased by use of the Graphoscope, which contains, besides, a pair of glasses for looking at stereoscopic views—diameter of larger glass, four inches. **Presented** for **8** subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay expressage.

No. 32.—Simple Microscope.—Price 80 cents.—Another magnifying glass, which answers all the purposes of the preceding, and has the advantage of being provided with legs, by which the proper focus is determined. A person not accustomed to the use of a magnifying glass, will find this one especially serviceable in examining counterfeit bank-notes, clover, grass, and seeds, etc. **Presented**, post-paid, for **1** new subscriber at \$1.50; OR, supplied for price, post-paid.

GOOD WATCHES AND CLOCKS.

No. 33.—A Good Time-Keeper.—Price \$10.00.—The very best watch, for the price, that can be found anywhere. It is made expressly for us, and is thoroughly reliable. The case is Nickel, heavily plated on German Silver, and very handsome. It can hardly be

told from silver, and does not tarnish with handling. No key, and no opening required, as the watch is a stem-winder and setter; the glass is a strong, flat one, with bevelled edges, and not easily broken. Watch weighs 4½ ounces, same size as the engraving. Sent, post-paid, to any post-office in the United States or Territories for price; OR, we will **Present** it, carriage prepaid, for 13 subscriptions at \$1.50 each.

No. 34.—Extra Silver Case Watch.—Price \$15.00.—A splendid watch, with coin silver case, extra high grade works, with 13 jewels, compensated balance, etc. Will prove a treasure to its owner; is just as serviceable in every respect, as a \$40.00 watch, as has been proved by many persons in our own office. **Presented** for 20 subscriptions at \$1.50 each. Carriage prepaid; OR, supplied for price. Popular Premium.

Old Reliability.—Year after year we offer this splendid watch as a premium, because we find it, from actual use in this office, as well as from trial by thousands of our subscribers, to be the best and most reliable Silver Watch for the money ever made in the world. One of the officers of this Company carries no other watch than this, and several of the heads of departments have used them for years. Hence we say "Old Reliability." No. 35,

No. 35.—Silver Hunting-Case Watch.—Price \$16.00.—Stem-winder and setter, with second hand, and the same in all particulars as the preceding, except that it has a strong, handsome hunting case of coin silver. We **Present** this beautiful Premium for 22 subscribers at \$1.50 each; OR, supply it for the price,

No. 36.—Parlor Clock.—Price \$16.00.—A very pretty mantel ornament, and good time-keeper. Made of Marbleized Iron, with a graceful bronze figure on the top, and gilt decorations. It is a striking clock, and runs eight days. We will **Present** it for 19 subscriptions at \$1.50 each; OR, supply it for the price. Receiver to pay freight, which is small. See below.

No. 37.—Nickel-Plated Clock.—Price \$5.00.—Very valuable at night, as well as in the daytime. When the little knob at the top is touched the clock strikes the last hour. It requires only one winding. One day strike. Entire glass front. Seven inches high. Will be **Presented** to any one who sends us 5 subscriptions at \$1.50 each; OR, sent for the price. Expressage small, to be paid by the receiver. See below.

No. 38.—Octagon "Peep O'Day" Clock.—Price \$2.70.—One of the most popular Premiums. This little clock should be found in every home. It can be carried about in the hand without receiving

any injury, and has an Alarm. Is wound and set at the back. Nickel-finish, octagon-shape, 1 day strike (repeating). The face measures 4 inches in diameter, and has a second hand, with small dial. **Presented** for 3 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

No. 39.—Drop Octagon Clock.—Price \$6.00.—This handsome Clock measures 2½ inches in height, and is made to hang on the wall. Suitable for the sitting or dining room. Black walnut, with gilt finish, and white dial, measuring 10 inches in diameter. It is a reliable time-keeper, ornamental as well as substantial-looking, and will run for eight days. The upper part of the clock is octagon-shape. It will be **Presented** to any one who sends us 6 subscriptions at \$1.50 each; OR, supplied on receipt of the price. The cost of expressage small, to be paid by the receiver in either case.

RUBBER GOODS.

PRESERVE YOUR HEALTH.

No. 40.—Reversible Checked Rubber Coat.—Price \$6.00.—The best Protection against wet is a rubber coat, which may be easily slipped on over any quantity of clothing. The one we offer is particularly desirable, being strong, durable, thoroughly waterproof, and at the same time very light—weighing only from 16 to 20 ounces, according to the size. Has a checked lining, and can be worn with either side out. In ordering one, a person's height, weight, and the size around the body (just below arms) must be given. We will send a rubber coat in a convenient pouch or case, to any Post Office in the United States or Territories, on receipt of price; OR, will **Present** one, post-paid, for 8 subscriptions at \$1.50 each.

No. 41.—Rubber Cap, with Cape.—Price \$1.50.—This cap keeps off the rain, not only from the head, but also the throat, neck, and shoulders, while the little roof in front protects the face, and the opening is just large enough for seeing and breathing. We will send a water-proof cap and cape to any address in the United States by mail, post-paid, for \$1.50; OR, **Present** one post-paid for 2 subscriptions at \$1.50 each. Size in inches must be sent—hat-dealer's measure, or where hat encircles the head.

No. 42.—Rubber Leggings.—Price \$2.00.—These are indispensable to any one who goes out into wet grass, as they are a perfect protection for the legs. They weigh from 5 to 6 ounces, according to the size required. In ordering, state whether large, small, or medium size is wanted. We will send a pair of these leggings, post-paid, for 3 subscriptions at \$1.50 each; OR, supply them for the price, post-paid.

No. 43.—Complete Rubber Outfit.—Price \$9.00.—The person who obtains this Premium (the above described Cap, Coat, and Leggings), will be the fortunate possessor of a complete water-proof outfit, which will be the means of saving him both time and money; a fit of illness (and consequent doctor's bills) is often brought on by exposure to rain or snow, so that this rubber suit will be found a good investment—the double interest on it being only 2 cents a week. We send the Combination Cap, Coat, and Leggings for 11 subscriptions at \$1.50 each; OR, supply them, post-paid, for \$9.00.

No. 44.—Ladies' Waterproof Circular—Price \$4.50.—This is a "feather-weight," and can easily be carried in the pocket, but is strong and durable, and of the best quality. Made by the well-known Goodyear Rubber Company, and fitting into a neat rubber case. Every lady who is likely to go out in bad weather should have one, and she will never have cause to regret the expense. A poor article of this kind is never cheap, however low the price may be. Sent post-paid to any part of the United States for \$4.50; OR, **Presented** for 6 subscriptions at \$1.50 each, post-paid. Send your measure from neck to bottom of walking-dress, or name length desired, from neck down. Circulars vary from 50 to 60 inches in length.

ELEGANT * GOLD-PLATED * JEWELRY.

LATEST AND MOST FASHIONABLE DESIGNS.

Gentleman's and Boys Watch Chains.

Fine Quality Rolled Gold Plate.

No. 45.—Price \$3.50.—A remarkably solid looking watch chain, of tightly twisted double links. Will wear a long time and always be admired. Has a short chain for charms attached. **Presented** for 4 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

No. 46.—Price \$3.50.—A new pattern, square links, alternate plain and spiral. A very good and durable chain for a young man. Provided with bar, spring-loop, etc. **Presented** for 4 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

No. 47.—Fire-gilt Chain with Charm.—Price \$1.25.—A remarkably good chain for the price. Very pretty design, and having a charm in which the stone is a good imitation of Cameo on one side, and Intaglio on the other, each bearing a female head. A very showy article. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

man. Same length as above, with attachments. **Presented** for 5 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

Two Watch Chains for Ladies.

Rolled Gold Plate.

No. 52.—Price \$5.00.—A beautiful chain for a lady, of particularly chaste pattern, consisting of tiny double links; cube-shaped slides, prettily chased. Nothing could be more elegantly simple for either a young or an old lady, than this chain. It will be **Presented** for 6 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

No. 53.—Price \$4.00.—An elaborate chain, suitable for a young lady. It is in two shades of gold, and has ball-shaped slides, each of which contains two turquoises and two rubies. Furnished with patent spring rings. A most beautiful and acceptable present for a lady friend. **Presented** for 5 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

sash or ribbon, or worn by a young lady as a brooch. It is of two shades of gold, and has a diamond in the centre of the daisy. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

Gold Bangles.—Brooch and Ear-Rings.

Best quality rolled gold plate. The styles are the same as those sold in solid gold and it is impossible to distinguish these goods from real. Different sizes can be had, and each pair is packed in a suitable box.

No. 60.—Price \$6.00.—A remarkably handsome and massive-looking pair of bangles, in two shades of gold. Heavily ornamented with balls and rings, covered with filigree work. A very elegant present for a lady. **Presented** for 7 subscriptions at \$1.50 each; OR, supplied for the price. Prepaid in either case.

No. 61.—Price \$4.50.—A pretty and delicate pattern in yellow gold with six turquoises in each bangle. Very appropriate for a young lady. **Presented** for 5 subscriptions at \$1.50 each; OR, furnished for the price. Postage prepaid in either case.

No. 48.—Price \$3.00.—Is a light, pretty chain for a young man or boy. Loosely twisted links, with short attachment for charms, a spring loop, etc. Very stylish, and genteel looking. **Presented** for 3 subscriptions at \$1.50 each; OR, supplied for price, post-paid, in either case.

No. 49.—Price \$3.50.—Heavy chain for a Gentleman's use, prettily chased. A thoroughly reliable and substantial article, and a very handsome present for a friend. **Presented** for 4 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

No. 58.

No. 59.

No. 50.—Price \$3.50.—A magnificent cable chain, very heavy and substantial looking. About fourteen inches long, and with the usual attachments. **Presented** for 4 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

No. 51.—Price \$5.00.—Elegant curb chain of unique design; desirable for either an old or a young

Ladies' Pins—Latest Styles, With Rolled Gold Mountings, and Perfect Imitation Diamonds.

No. 54.—Lily Pin.—Price \$1.50.—For fastening the shawl or fichu. A large Calla Lily, with a very fine imitation diamond in the place of the stamen and pistils. Rolled gold plate. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

No. 55.—Crescent-top Pin.—Price \$1.50.—An elaborate Jersey pin, having a double crescent with two stars, and a diamond at the top. Around the stem is coiled a delicate Calla Lily spray with two leaves. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

No. 56.—Daisy Pin.—Price \$1.50.—A very unique design of pin. Suitable for wearing at the throat, fastening a scarf, etc. The centre of the daisy is a diamond. This elegant pin will be **Presented** for 2 subscriptions at \$1.50 each; post-paid.

No. 57.—Jersey Pin.—Price \$1.50.—This elegant pin is a flower-spray, with a diamond set in a coil of gold above it. It can be had for 2 subscriptions at \$1.50 each; OR, will be supplied, post-paid, for price.

No. 58.—Lace Pin.—Price \$1.50.—This little pin is of two shades of gold, prettily marked, the pattern being a double spray of star-vine, with a diamond in the centre flower. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied, post-paid, for price.

No. 59.—Lace or Sash Pin.—Price \$1.50.—The pattern seems especially suited to a child, and this pin (as well as the above), can either be used to fasten a

No. 62.—Price \$2.50.—A simple, less elaborate style than the above, but extremely elegant and lady-like. Two shades of gold, ball-cuds chased and ornamented. The most suitable pair for a young girl. **Presented** for 3 subscriptions at \$1.50 each; OR, furnished for the price. Prepaid in either case.

No. 63.—Price \$4.50.—These bangles have three real garnets on each side of the centre ornament, which is prettily chased and decorated in filigree. They will be **Presented** for 5 subscriptions at \$1.50 each; OR, sent for the price. Prepaid in either case.

No. 64.—Brooch and Ear-Rings.—Price \$3.00.—A very graceful and delicate pattern in two

shades of gold. Each of the pieces has a wonderfully good imitation diamond, hanging in a slender ring. The whole set, brooch and ear-rings, will be sent, post-paid, for 4 subscriptions at \$1.50 each; OR, furnished for price.

Gentlemen's Locket.—Watch Charm.

No. 65.—Price \$1.75.—Green agate and blood-stone locket. Turns on a pivot, and contains places for two pictures, etc. Very handsome. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

No. 66.—Price \$1.75.—Moss agate on one side, and green agate on the other. Similar to above in all other respects.

No. 65.

No. 66.

respects. An ornamental addition to a gentleman's watch chain. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

No. 67.—**Pearl Front Locket.**—Price \$2.50.—Very elegant, with a stag's head beautifully chased on a background of pearl. All these lockets are of fine rolled gold plate, and will be found very durable. **Presented** for 3 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

No. 67.

No. 68.

No. 68.—**Gentleman's Watch Charm.**—Price 75 cts.—A pretty ornament for the watch chain. Red Agate on the back, and delicately chased design on front—horse's head and horse-shoe. **Presented** for 1 subscription at \$1.50; OR, supplied for price. Post-paid in either case.

Gentlemen's Sleeve and Front Buttons.

No. 69.—**Gentleman's Sleeve Buttons.**—Price 75 cts.—Fine, strong looking buttons, with a large, sparkling gold-stone in each. Patent Acme Lever Back. Very handsome buttons. **Presented**, post-paid, for 1 new subscription at \$1.50; OR, supplied for the price, post-paid.

No. 69.

No. 70.

No. 70.—**Sleeve Buttons.**—Price \$1.00.—For either lady's or gentleman's wear. Best rolled gold plate, with patent Acme lever shanks, non-separable. Prettily ornamented with bird pattern. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

No. 71.—**Gold Front Buttons.**—Price \$2.50.—Very chaste design of border, with a diamond star in center—a beautiful imitation. Can be worn by either a lady or a gentleman. Patent Acme Lever Back. **Presented** for 3 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

16 Carat Hard Solder Gold Rings.**Latest Styles.**

No. 72.—**8 Pearls and 4 Garnets.**—Price \$3.50.—A very handsome style; four garnets with four pearls on each side of them. Suitable for either a lady or a gentleman. **Presented** for 4 subscriptions at \$1.50 each; OR, sent for the price. Prepaid in either case.

No. 89.

No. 89.—**Plain Ring.**—Price \$1.50.—Very handsome looking plain oval ring of filled gold. It will be **Presented** for 2 subscriptions at \$1.50 each; OR, sent on receipt of the price. Postage paid in either case.

FOR FAMILY USE.

No. 90.—Student's Lamp.—Price \$5.00 and \$6.00.—It has been asserted by good authorities that 90 per cent of all the defective eye-sight is attributable to the use of insufficient or unsteady light. Flickering, however slight it may be, is exceedingly injurious to the eyes. The German Student Lamp is the best, the most economical, and the safest that can be found; the double reservoir (on the right of the engraving), lets out the oil according as it is needed, keeping it always at the same level, near the wick, and producing a bright, steady and uniform flame. The Argand burner, with the tall chimney, having a contracted neck, produces a strong draft, which consumes the oil instead of letting it escape as invisible unconsumed carbon as other lamps do. For reading, writing, sewing, etc., the Student's Lamp has no equal and is considered superior to gas, as the centre of a family evening gathering. We can supply the larger size complete, with white glass shade, chimney, etc., for \$5.00 in polished brass; or, for \$6.00 finely nickel-plated; OR, **Presented** the former for 7, and the latter for 8 subscriptions at \$1.50 each. Carriage to be paid by receiver, and 25 cents extra for boxing, if it is to go by freight or express. (See below.)

chimney, etc., for \$5.00 in polished brass; or, for \$6.00 finely nickel-plated; OR, **Presented** the former for 7, and the latter for 8 subscriptions at \$1.50 each. Carriage to be paid by receiver, and 25 cents extra for boxing, if it is to go by freight or express. (See below.)

No. 91.—Lemon-Squeezer.—Price 75 cents.—This is a combination of Lemon squeezer, Nut-cracker, and Cork-presser, three very useful articles. The "Dean" patent consists of a half-pint tumbler with a lip, set in an iron frame; the tumbler has a "shoulder" around the inside, upon which rests an inverted hollow truncated cone made of earthenware, and pierced with holes in the top. Half a lemon is placed over these holes, and when the lever is depressed, the juice falls into the glass from which it is poured without danger of spilling. The Cork-presser or Nut-cracker is between the levers on the right of the tumbler. Size No. 2, which has a ten-inch lever, will be **Presented** for 1 new subscription at \$1.50; OR, supplied for price. Several of these lemon-squeezers can be sent in one parcel, at little more cost than that of one. The small expressage is to be paid by receiver. (See below.)

No. 92.—Champion Clothes Wringer.—Price \$5.00.—All stiff springs, cog wheels, etc., are discarded, the pressure being obtained by pivoted levers. The frame is made of galvanized malleable iron; the rolls of white rubber; the whole is simple and durable, and not likely to get out of order. Given for 5 subscriptions at \$1.50 each; OR, supplied for the price. Receiver paying freight. (See below.)

No. 93.—"Little Detective Scale."—Price \$3.50, with Platform and Tin Scoop.—This little Scale is made with Steel Bearings and Brass Beam, and weighs accurately any package from ½ oz. to 25 lbs. It

is nicely adjusted, and an almost indispensable article for the House-keeper. Useful also for weighing mail matter. 4 subscriptions at \$1.50 each will secure it; OR, we will supply it at the price. Carriage to be paid by the receiver. (See below.)

No. 94.—Call Bell, and Adhesive Hooks.—Price 50 cts.—A small, strong bell for household or business use, with a sweet, clear tone. Made of iron and steel-plate. Besides this, a box containing 25 patent Adhesive Suspension Hooks, which no family should be without. Though made of thin wire and paper, they will, when fastened to the wall, sustain several pounds weight, and are very ornamental, being brightly colored leaves, or pretty views, figures, heads, etc. The back of the paper is covered with strong gum, and is to be moistened, and pressed tightly against the wall or

wood-work, and can be washed off if desired. The Bell, and a box of these useful Hooks, with directions for putting up, will be **Presented** for 1 subscription at \$1.50; OR, supplied for price. Postage paid in either case.

No. 95.—Autograph Album.—Price \$1.50.—An elegant present for a lady friend. This Album is of garnet plush, with raised satin, tea-rose and leaves on one side. Measures 7x4 inches, and contains an illustrated and illuminated title page, gilt-edged leaves, superior quality paper in five delicate tints. This beautiful book will be **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

No. 96.—Scrap Book.—Price \$1.00.—Covered in mouse-colored cloth, with the front gorgeously illuminated in an elaborate raised pattern: birds, butterflies and flowers, in gilt and brilliant colors. Measures 9x13 inches, and contains heavy white leaves with red edges. Very ornamental, and useful for preserving pictures, scraps from newspapers, etc. Will be **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for price. Prepaid in either case.

No. 97.—Domestic Type Writer.—Price \$1.00.—Useful for both household and business purposes, simple in construction, and very easy to use. It will be found serviceable for lettering cards, directing envelopes, writing letters, and for numberless other operations. Instructive and amusing for children, as it will teach them the letters, and how to make words and sentences, and be at the same time an interesting pastime. This little machine is well made, very durable, and is packed in a strong box, with two colors of Ink-powder, and full directions for use. **Presented** for 2 subscriptions at \$1.50 each; OR, sent for price, post-paid in either case.

No. 98.—Writing Desk.—Price \$3.50.—A handsome desk for a lady or a young man; measures 13x9x5 inches. Real walnut, ornamented in black and gilt, and lined with purple velvet. Has both upper and lower

receptacle for note paper, etc., places for pens and ink, and a foot ruler. It will be **Presented** for 4 subscriptions at \$1.50 each; OR, furnished for the price. Receiver to pay freight charges in either case. (See below.)

No. 99.—Writing Desk.—Price \$4.50.—A pretty little desk of dark, polished wood, decorated. To open it, pull out the drawer in front—a new design. It is lined with purple velvet. A very convenient, and at the same time ornamental article. **Presented** for 5 subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay expressage, which is small.

No. 100.—Small Writing Case.—Price 75 cts.—Covered in black cloth, embossed; with steel finish, and having a lock and key. Lined with white, watered paper, and containing a blotting book, a compartment for paper and envelopes, a pen-holder, ruler, two sticks of superfine sealing wax (red and bronze), a metal case for pens, and a good lead pencil. A very nice portfolio for a boy or girl. **Presented** for 1 subscription at \$1.50; OR, supplied for price. Post-paid in either case.

No. 101.—Portfolio.—Price \$1.25.—Larger size than preceding. Covered in brown cloth, prettily decorated in gilt, furnished with a lock and key. The inside is of figured oiled paper, black and wine-colored, with gilt ornaments—pretty and substantial looking. Contains two compartments, one marked "Correspondence," some envelopes; an eight-inch ruler; pen-holder and pencil case, all of light wood, and a blotting book. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

No. 102.—Ink-Bottle in Case.—Price 50 cts.—Having a patent double cover, with very strong spring, this case is so secure that it can even be carried in the pocket without any danger of the ink's spilling. The inside of the case is entirely of brass, and contains a small glass bottle, which can be taken out to be washed and filled. The outside is covered in bright-red Morocco with brass finish. A most convenient and satisfactory article. **Presented** for 1 subscription at \$1.50; OR, supplied for the price. Post-paid in either case.

No. 103.—Perambulator.—Price \$13.50.—This baby carriage is made of either wicker or slats, and we will furnish which ever is preferred. The inside is entirely covered with all wool reps, and it has a hand-

rail, handle tips, hub caps, and curtains. The latter, when not in use, kept in the patent "Valise-top," which is also a convenient receptacle for many small articles. This Perambulator will be **Presented** for 17 subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay express charges in either case. (See below.)

No. 104.—Plush Hand-Mirror.—Price \$1.25.—An exquisite plate glass Mirror, with back and frame of wine color silk plush of finest quality. Measures six by four inches. Its greatest advantage is a strong folding support in steel, by which it can be hung up, stood on the table, or held in the hand. It is especially convenient for gentlemen while shaving, as it can be changed by means of the steel support, and adjusted to any position to suit the face. Ordinary glasses with a support can only be placed in one position. Here, by means of the adjusting support, the mirror is changed to any position. It will make a most beautiful

present for a lady to a gentleman friend. It is equally appropriate and beautiful for a lady's boudoir. One of the staff of the *American Agriculturist* procured a similar one in Europe last year, and was perfectly delighted with this adjusting mirror. It has now been brought out here; and while we offer it at \$1.25, it is sold from \$1.50 to \$2 in drug stores. We consider this plush mirror as one of the most desirable premiums we offer. They ornament the bureaus of several of the Editors of this paper; and we believe that every present subscriber of the *American Agriculturist* will immediately send for one as soon as the other subscribers in his town may receive one for exhibition. **Presented for 2 subscriptions at \$1.50 each; OR, sent for price, post-paid in either case.**

No. 105.—Florence Spool Cabinet.—Price \$1.50.—Real walnut, with ebonized trimmings. A useful and pleasing present for a lady. Stands eleven inches high, is 4½ inches deep, and 8 inches wide. Has a convex front with patent sliding doors; the interior is a double tray, containing places for fourteen spools of cotton or silk, and a velvet cushion for needles and pins. This pair of trays revolves on a screw, so as to be brought completely outside of the cabinet, when in use. Underneath is a draw for sewing materials, work, etc. This cabinet is an ornament to any room, especially with a pretty statue standing on top of it, and should be owned by every lady who does the sewing for her family. **Presented for 2 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.**

No. 106

No. 107

No. 106 and 107.—Gold Thimbles.—Price, No. 106, 62 cts., No. 107, \$2.00.—The "Patent Graduated Filled Gold Thimble," will outlast two of pure gold, as the metal is too soft for use without some alloy. One of these two is handsomely engraved, and each is put up in a velvet lined case. The more ornamental one will be **Presented for 2 subscriptions at \$1.50 each; and the other for 1 subscription. Either will be sent, post-paid, for price.**

No. 108.—Buttonhole Scissors.—Price 75 cts.—Indispensable to ladies. These little scissors are of superior quality, and have a patent screw-gauge. **Presented for 1 subscription at \$1.50; OR, supplied for the price. Post-paid in either case.**

No. 109.—Crumb Brush and Tray.—Price \$1.00.—Prettily painted and ornamented in bright-colored wreath pattern. Two premiums in one. Brush and Tray will be sent post-paid for 2 subscriptions at \$1.50 each; OR, supplied for the price.

No. 110.—Plush Cologne Set.—Price \$1.25.—An elegantly quaint-looking little article, very appropriate as a present to a young lady. Measures five inches in length, and stands four inches high. It is a slipper of garnet silk plush, of finest quality, with a beetle embroidered on the toe, in pea-cock blue and other shades of silk; red satin sole, brass headed nails in heel and handle; the latter also of garnet plush. A perfume bottle fits into the slipper, but can be taken out; it is cut-glass, stands three inches high, including the stopper, and can be used for holding cologne, essence, smelling-salts, etc. This very attractive Premium, which will be ornamental to any parlor or toilet table, will be **Presented for 2 subscriptions at \$1.50 each; OR, sent for the price, post-paid in either case.**

No. 111.—Card Case.—Price \$1.00.—Made entirely of tortoise shell, and suitable for either a lady or a gentleman. Very stylish, and at the same time substantial; will hold a number of visiting cards, and is of convenient size and shape for slipping into the pocket. Measures 4x2½ inches. Furnished with a metal spring fastening, and finished inside with white ivory. A very pretty present for a friend. **Presented for 2 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.**

No. 112.—Plush Satchel.—Price \$2.50.—Lady's elegant hand-satchel, of the most fashionable shape, with outside pocket for handkerchief. Dark color-

ed plush, and kid of fine quality, with steel finish. Has plush handle, neat lining, and inside pocket. **Presented for 3 subscriptions at \$1.50 each; OR, supplied for price. Postage paid in either case.**

No. 113.—Ladies' Satchel.—Price \$2.25.—Made of light tan-color crocodile leather, with steel fin-

ish and a good clasp. The handle is of leather, and the lining of soft, fine kid in fawn color. Inside pocket. A particularly serviceable and stylish looking bag for a lady. **Presented for 3 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.**

Beautiful Albums.

No. 114.—Photograph Album.—Price \$2.50.—Strongly bound in fine black Morocco, ornamented with a spray of raised satin flowers, in gilt, silver and colors. Firm brass clasp, gilt-edged leaves, decorated title-page, places for twenty-four large photographs, and twenty-eight small ones, and gilt-finished pages. A very substantial and handsome book. **Presented for 3 subscriptions at \$1.50 each; OR, supplied for the price. Receiver to pay expressage in either case.**

No. 115.—Price \$3.50.—This handsome Album measures 9½ by 8 inches, and is strongly bound in maroon morocco, embossed, and ornamented with an elaborate raised spray of flowers in colored satin, gilt and silver, and has the word "Album" in gilt on the back. Strong nickel-plated clasp, and gilt-edged leaves. Contains 31 tinted and gilded pages, having places for 70 photographs of 3 sizes—card, imperial, and panel, and openings of various shapes. Fly-leaves of heavy, white, watered paper, and a beautiful title page—a water-view in delicate aesthetic tints. This handsome and durable book will be **Presented for 4 subscriptions at \$1.50 each; OR, supplied on receipt of the price. Receiver to pay small expressage in either case.**

No. 116.—Small Photograph Album.—Price \$1.25.—A pretty little Album for holding small photographs. Bound in garnet leather with arabesque and flower designs in black, gilt, and silver. Measures 5x4 inches. Brass clasp, gilt-edged leaves, and places for three dozen pictures. The pages are tinted, and finished in gilt lines, and the binding is strong and durable. **Presented for 2 subscriptions at \$1.50 each; OR, supplied for the price, post-paid in either case.**

No. 117.—Another Small Album.—Price 75 cents.—Bound in light garnet leatherette, prettily decorated with a raised flower-spray in gold and silver. Nickel-plated clasp, white-watered fly leaves, and in all respects similar to the preceding, though much less expensive. **Presented for 1 subscription at \$1.50; OR, sent for the price, post-paid in either case.**

Pocket Books for Everybody.

No. 118.—Price \$1.25.—Crocodile leather, light-colored, with steel finish. Lined with kid and sateen of same color, and containing six compartments, ivory top lead pencil and two silicate pages for memoranda, which can be washed off. A strong, flexible, and genteel looking book. **Presented for 2 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.**

No. 119.—Price \$1.00.—A beautiful little purse of unique shape, covered with untanned deer skin in white and fawn color; garnet plush sides and satin cords, tassels, etc. Steel finish, and light kid lining. Suitable for a young lady. **Presented for 2 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.**

Contains five compartments, besides an extra secure one for gold, etc. **Presented for 2 subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.**

No. 121.—Price \$1.00.—Gentlemen's Pocket book, of tan-colored, flexible Calf, with strap to match, and worked border. Lining of kid and red Silesia, with satin finish, special compartments for bank notes, etc. A very durable and handsome book. **Presented for 2 subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.**

No. 122.—Price 50 cts.—A very genteel little purse, made of softest glove kid; maroon, with tan-kid lining and steel finish. Of a very convenient size for carrying

in the pocket. **Presented for 1** subscription at \$1.50; OR, supplied for price. Postage paid in either case.

No. 123.—Price \$1.25.—A handsome pocket book of wine-colored plush and kid, both of good quality. Lined with mouse-colored kid; having six compartments and steel finish. **Presented for 2** subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

For Gentlemen.

No. 124.—Smoker's Cabinet.—Price \$1.50.—Any man that enjoys smoking, will appreciate the comfort of having his cigars, pipes, etc., kept in a neat, secure case, and always to be found in the same place. The Smoker's Cabinet is very ornamental and compact-looking, standing ten inches high, and manufactured of real walnut, with ebonized finish. At the bottom is a

drawer for tobacco and pipes, above that, are places for two dozen cigars on a revolving stand, with patent convex sliding doors. On the top is a receptacle for matches, with hinged cover. This remarkably complete and convenient cabinet will be **Presented for 2** subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

No. 125.—Cigar Case.—Price \$1.00.—A strong, fine looking case, for carrying cigars in the waist-coat pocket. Made of light-colored crocodile leather, sewed. A very sensible present for a gentleman, as it will last for years. **Presented for 2** subscriptions at \$1.50 each; OR, supplied for price. Postage paid in either case.

No. 126.—Shaving Set.—Price \$5.75.—Two fine quality steel razors, with white, ivory handles, manufactured by Wade & Butcher; a Goldschmidt's razor-strop, and a shaving brush. This complete set fits into a leather case, and will be **Presented for 7** subscriptions at \$1.50 each; OR, furnished for price. Post-paid in either case.

No. 127.—Razor.—Price \$1.50.—A good black handled razor, fine steel. Same manufacture as above. It will be **Presented for 2** subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

Pens and Pencils, etc.

No. 128.—(Price \$2.00).—Suitable for either a lady or a gentleman, and can be carried in the pocket. The holder is of fine rolled plate, with a slide, and a solid gold pen. We **Present** it for 3 subscriptions at \$1.50 each; OR, supply it, post-paid, for price.

No. 129.—Price \$1.75.—This premium is especially valuable for persons who require a pocket pen for frequent use. It is a fine black reversible holder, with plated mountings, and a solid gold pen. A thoroughly substantial article, and always popular. **Presented for 3** subscriptions at \$1.50 each; OR, supplied, post-paid, for price.

No. 130.—Ever-Pointed Pencil.—Price 50 cts.—A splendid substitute for the ordinary wooden pencil, saving its owner the time and trouble of sharpening. It contains a long lead which is *always pointed*. **Presented for 1** subscription at \$1.50; OR, supplied, post-paid, for price.

No. 131.—Price 50 cts.—A fine rolled gold plate tooth-pick, with solid gold point. A very desirable arti-

cle, and always acceptable as a present. **Presented for 1** subscription at \$1.50; OR, sent, post-paid, for price.

No. 132.—Gold Mounted Pocket Pencil.—Price 60 cts.—This Pencil is an invaluable companion to every man, whatever his calling. It is strong and handsome, a convenient size for the pocket—three and a half inches in length. Is made of hard, black rubber, with elegant gold mountings, and is of excellent, though simple construction. Every pencil is *warranted*, and thousands are sold weekly. The leads do not break easily if proper care is taken, and with a little foresight the pencil can be kept ready for use. To put in a lead, unscrew the point and slip the lead in as far as necessary, holding the pencil upright, then screw the point tight again. The thread inside the tube prevents the biting off of the lead, as in "claw" pointed pencils. The large black leads, or copying leads, are the best to use. 1 new subscription at \$1.50 will secure this handsome and useful Premium, post-paid; OR, we will supply it, post-paid, for price.

No. 133.—Fountain Pen-Holder.—Price \$4.50.—The famous Johnson Fountain Pen-holder, is absolutely invaluable to any one who writes much, particularly to a doctor, lawyer, etc. Each pen is guaranteed to last for *five years*; the holder can contain ink sufficient for writing 40,000 words *without dipping*, and is the greatest possible saving of time. Made of gutta-percha, and fitted with a substantial looking black case. We **Present** this valuable pen for 5 subscriptions at \$1.50 each; OR, send it, post-paid, for price.

No. 134.—Black and Gold Pen Holder.—Price \$2.50.—The handle is black, with elegantly

chased gold-plate mountings, and a **real gold** pen. Sliding holder for convenience in carrying. Suitable for either a lady or gentleman, and very handsome. **Presented for 3** subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

No. 135.—Pearl and Gold Pen Holder.—Price \$3.00.—An elegant article for a lady's use, fitted into a kid case. Pearl handle and gold plate holder, with a real gold pen. Nothing could be a more beautiful present for a lady friend. **Presented**, post-paid, for 4 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

No. 136.—Gold Pencil Case.—Price \$1.25.—This handsome Pencil Case measures only two inches when closed, having the patent Magic Bell Head. It is heavily plated with gold and exquisitely chased, and has a receptacle for leads, which is a great convenience. **Presented for 2** subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

No. 137.—Gold Pen and Pencil Combined.—Price \$3.00.—A most beautiful present for either a lady or a gentleman. Heavily plated gold case, containing a No. 4 diamond-pointed pen, *warranted*, and a movable pencil case. The engraving shows it as *pen* and *pencil*, also as *closed*, and ready for the pocket. This is a very handsome and reliable article. **Presented for 3** subscriptions at \$1.50 each; OR, supplied for price, post-paid. Either a stiff, limber, or medium pen may be had.

*USEFUL,*INSTRUCTIVE,*AND*ENTERTAINING.*

No. 138.—Wilcox Telephone.—Price \$1.00.—With 300 feet of Wire. This simple little instrument will meet a general want in taking the place of speaking tubes and electric bells, at *less than one-quarter* the cost. One of its many recommendations is the readiness with

son will have the least difficulty in arranging and conducting this Telephone, and its value for practical use is inestimable. It will be **Presented for 2** subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

which it may be put to practical use, in connecting rooms or adjoining buildings. The manufacturers claim that it has been thoroughly tested, and is a perfectly reliable instrument. With it the farmer can have direct communication between his house and his barn, or some part of his farm; the merchant, manufacturer, or me-

No. 139.—Magnetic Telegraph.—Price \$1.00.—With this instrument boys and girls can learn the art of telegraphy, and at the same time enjoy a fascinating pastime. The base of the instrument measures 6½ by 3 inches, and on this are the following: Carbon cell; zinc plate; induction coil; highly polished metal bell;

chanic can connect his place of business with his home; neighbors can connect their houses, and boys and girls speak to their young friends from a distance. **Outfit** consists of: Two polished Walnut Transmitters; 300 feet Composition Wire; Leather Cords and Loops; Metal Screw Eyes for using at turns. All packed in a firm, wooden case, accompanied by exact and simple directions for putting up and operating. No intelligent per-

a hammer; two switches; brass key; phial of bi-sulphate of mercury; besides, full directions for adjusting the battery, telegraphing between two stations, and making battery fluids. Also, the great "Western Union Telegraph Co.'s" code of signals—alphabet, numerals, punctuation, etc. The complete instrument will be **Presented for 2** subscriptions at \$1.50 each; OR, supplied for the price. Postage paid in either case.

CUTLERY, ETC.

Knives, Scissors, Etc.

No. 140.—The Pocket Knife to Have.

—Price \$4.00.—Any one who has ever owned or used a *Multum in Parvo*—"Much-in-Little" pocket knife, will testify to its being a most valuable companion for man or boy. It is, in fact, equal to a whole pocketful of tools, for numberless are the occasions on which it comes into use in the course of a day. It is made of good quality steel, and has ivory sides. When closed it is three

A Standard Premium.

inches long, neat and compact, not heavy and clumsy-looking, as are so many combination knives. A strong *Screw-driver* always at hand in the end of the knife, is effective in turning a screw of any size up to an inch, or even more, while the broad back of the hook is a small *Hammer*. Out of the end of the knife may be drawn a steel *Pointer*, nearly two inches long, which serves as a slim brad-awl, etc.; also a fine pair of *Tweezers*; from within the knife there opens the following: a large *Blade*, and a small one; a Saw with double row of teeth, strong enough to use on boards up to an inch thick; a good *Gimlet*; a three-cornered pointed steel *Punch*, or *Rim-mer*, always useful for making holes in harness, wood, etc.; a *Corkscrew*; a hook, which folding over the smaller

KNIFE CLOSED.

tools makes a sort of *Nut-cracker*, with the hollowed-out handle, and can besides be used for a number of purposes, such as raising a stove-lid, lifting any hot vessel, pulling on boots, or taking gravel out of a horse's hoofs. The knife is worth much more than its mere cost—twenty-five per cent on which, for interest and wear, is less than two cents a week. **Presented**, post-paid, for 5 subscribers at \$1.50 each; OR, supplied, post-paid, for price, to any place in the United States. The best knife, and the most popular we have ever offered.

No. 141.—Price \$1.00.—It is a four-bladed pocket-knife, with a strong stag-horn handle. A most invaluable companion for man or boy. Either one of these knives will be sent, post-paid, for 2 subscriptions at \$1.50 each.

No. 142.—Price \$1.00.—A much larger knife, with a large and a small blade, and a stag-horn handle. A very useful knife to a farmer. **Presented** for 2 subscriptions at \$1.50 each, post-paid.

No. 143.—Price \$2.00.—A remarkably handsome knife with four blades (fine quality steel), and pearl handle. Suitable for a present. Sent, post-paid, for 3 subscriptions at \$1.50 each.

No. 144.—Price \$2.00.—A Lady's Knife, very pretty and dainty-looking, and at the same time serviceable. The blades are of the best quality, and the handle of pearl. Sent, post-paid, for 3 subscriptions at \$1.50 each. We will supply any of these knives, post-paid, for price.

No. 145.—Bread Knife.—Price \$1.00.—A strong reliable article, made of the best steel, and with the word "Bread" engraved on the blade. Serviceable in any house. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

No. 146.—Table Knives and Forks.—Price \$10.00.—One dozen knives, and one dozen forks of the best steel, will be acceptable to a housekeeper at any time. These are of medium size, and have strong, hard, rubber handles. **Presented**, post-paid, for 12 subscriptions at \$1.50 each; OR, sent for the price, post-paid.

No. 147.—French Cook's Set.—Price \$4.50.
—Knife, fork, and steel, of fine quality, intended for use.

The handles are made of celluloid or "Patent Ivory," which does not crack by being put into hot water, and always looks the same. The knife blade is ten inches long. We **Present** the complete set, knife, fork, and steel, for 6 subscribers at \$1.50 each; OR, supply it for price. Receiver to pay small express charges. (See below.)

No. 148.—Butcher's Knife and Steel.
—Price \$2.00.—Strong, and well made, and intended for hard wear. The material is of the very finest quality, and will not disappoint, but will prove satisfactory in

every respect. The knife is 8 inches, and the steel 10 inches long. We **Present** them both for 3 subscriptions at \$1.50 each; OR, supply them, post-paid, for price.

No. 149.—Pair of Shears.—Price \$1.00.—A sensible present to a lady, and serviceable to the whole household. Fine quality, and of a convenient size, with blades eight inches long. Sent, post-paid, for 2 subscriptions at \$1.50 each; OR, supplied for the price, post-paid.

No. 150.—Barney & Berry's "1" Skates.—Price, No. 1, Blued, \$2.75; No. 2, Nickeled, \$3.25.—No further recommendation is needed of Skates from this manufactory, than the satisfaction they uniformly give. The Heel Plates, Foot Plates, Toe Clamps, and Brackets, are made from crucible cast steel, and blued. Blades fine finish. Mode of fastening, same as the keyless lever skate. 3 subscriptions at \$1.50 each will secure a pair of these skates, No. 1, as above, or 4 subscriptions at \$1.50 each a pair of No. 2; OR, they will be supplied at the price named, receiver to pay expressage. In ordering, state size required, in inches and half inches. To ascertain the size, measure shoe from back of heel to toe.

No. 151.—Barney & Berry's "O" Roller Skates.—Price, No. 1, Blued, \$4.00; No. 3, Polished and Nickeled, \$6.00. The mode of fastening these fine roller skates, is of the "keyless" style. Every pair includes the French heel attachment, as shown in the cut, and may be used as a lady's or gent's skate, with or without the attachment. 4 subscribers at \$1.50 each will secure a pair of the Roller Skates, No. 1, or 6 subscriptions at \$1.50 each, a pair of No. 3; OR, they will be supplied at the prices named, receiver in either case to pay expressage, which is small. In ordering, state size required in inches and half inches. To ascertain the size, measure shoe from back of heel to toe. (See below.)

MUSICAL INSTRUMENTS.

No. 152.—Accordeon.—Price \$5.00.—This beautiful instrument has a double bellows, two sets of excellent reeds and a key-cover. It is of superior work-

manship, the corners well protected by metal bands, and is very ornamental. **Presented** for 6 subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay small express charges in either case. (See below.)

No. 153.—Concertina.

—Price \$3.50.—A very elaborately ornamented musical instrument of fine quality, and one which will entertain a whole room full of persons besides the performer. Only 4 subscriptions at \$1.50 each are required to secure it; OR, we will supply it, post-paid, for price.

No. 154.—American Zither.—Price \$1.50.

—This beautiful, harp-like instrument is easy to play, and being both light and small, can be readily carried about. It measures 18x8 inches, has fifteen strings and a key, and is made of light varnished wood, finished in red. Its name, "American Parlor Resonans Zither," is stamped on the front, with the musical notes, and numeri-

cal figures, by means of which a person can learn airs by heart, or play them at sight. Accompanying the instrument is a collection of Popular Melodies—twelve in all, ten songs, a waltz and a schottische. The Zither is rapidly increasing in popularity as a musical instrument, both for ladies and young men. **Presented** for 2 subscriptions at \$1.50 each; OR, supplied for the price. Postage paid in either case.

No. 155.—German Harmonica.—Price \$1.50.—This instrument is manufactured of finely polished black wood, and nickel-plated, and contains forty eight notes and tremolo. It will give satisfaction, and always be a source of pleasure to its owner. Sent post-paid for 2 subscriptions at \$1.50 each; OR, supplied, post-paid, for price.

No. 156.—Guitar.—Price \$6.00.—A beautiful instrument, more easily learned than the piano, and very much in fashion. This one is quite handsome enough to please an accomplished musician, and is, besides, an elegant ornament in a parlor when decorated with bows of bright-colored ribbons. It is particularly suited for accompanying the voice. **Presented** for 8 subscriptions at \$1.50 each; OR, sent for price. Receiver to pay expressage. (See below.)

TOOLS, FARM IMPLEMENTS, ETC.

No. 157.—Butter Salting Scale.—Price \$5.00.—Designed to meet the needs of all dairymen of a cheap, simple, accurate, and durable scale, always at hand, that will give any proportion of salt per pound

without figuring or weighing, and can be used by any one without trouble. You can get this scale for 6 subscriptions at \$1.50 each; OR, it will be supplied for the price. Receiver to pay small carriage. (See below.)

No. 158.—Farmer's Portable Forge.—Price \$12.00.—Just the thing for Small Shops and Farmers. Will heat 1½ inch iron to welding heat. A farmer can save the price of it every year by Sharpening Plows, Mending Wagons and Machinery, Shoeing Horses, etc., besides saving time when a bolt breaks, having the means at hand for repairs. 12 subscriptions at \$1.50 each will secure this Forge; OR, it will be supplied for the price. Receiver to pay small freight charges in either case. (See below.)

No. 159.—Adams' Combined Anvil and Vice.—Price \$6.50.—For Farmers and Mechanics. No. 1, 1½ inch jaw, weight 40 lbs. 6 subscriptions at \$1.50 each secure it; OR, it can be got for the price. Receiver to pay small freight. (See below.)

No. 160.—Amateur Vice.—Price \$1.00.—With 1½ inch jaw, or with 2 inch jaw. Price \$2.00.—These Amateur Vises are very handy things for light work. One new subscription at \$1.50 will secure the Vice with 1½ inch jaw, or two at \$1.50 each, will secure that with 2 inch jaw; OR, either will be supplied at price named, post-paid in each case.

No. 161.—Combined Truck and Bag Holder.—Price \$5.00.—Indispensable for the Farmer, Miller, Merchant, or Manufacturer. Combining a simple and complete sack-holder, with a strong, neat, and desirable truck. It is attached to the truck by means of clamps, and held in its place at any desired height by a thumb screw. 5 subscriptions at \$1.50 each will secure this; OR, it will be supplied at the price. Small freight charges to be paid by receiver.*

No. 162.—A Farm Bell.—These Bells are made of the best Bell-Metal, have a deep, rich tone, and give universal satisfaction to farmers and others who have received them. They are richly bronzed, and the hangings are included with each bell. We offer three sizes, as follows:

Diameter, 16½ inches, weight, 65 lbs. Price \$4.00
Diameter, 18½ inches, weight, 82 lbs. Price \$6.00
Diameter, 21 inches, weight, 130 lbs. Price \$10.00

We will supply the first named, for 5 subscriptions at \$1.50 each; the second, for 7 subscriptions; the third, for 11 subscriptions, all at \$1.50 each; OR, we will supply either at the price named. Receiver in either case to pay small freight. (See below.)

No. 163.—Farrier's Knife.—Price \$1.00.—A useful premium. Sent post-paid for 1 new subscription at \$1.50; OR, on receipt of price.

No. 164.—Farmer's and Mechanic's Blacksmith Tools.—Price \$40.00.—This most useful set of tools includes the Farmer's Portable Forge, and the Adams' Combined Anvil and Vice (see Nos. 158 and 159), and also the following:

18-inch Tongs.

2-lb. Hammer with handle. 1½ lb. Hot Chisel with handle. 1½-lb. Cold Chisel with handle.

No. 34 Stock and Dies.

Farrier's Pincers.

Farrier's Knife.

Shoeing Hammer.

Blacksmith's Drill.

With this Forge and Kit of Tools, any farmer can soon accustom himself to doing odd jobs, and save in a year more than the price of the whole. A most useful and valuable Premium. 40 subscriptions at \$1.50 each will secure it; OR, it will be supplied for the price. Receiver to pay small freight in either case. (See below.)

No. 165.—Gem Soldering Casket.—Price \$1.25.—This premium will prove a means of incalculable saving, not so much of direct expense as of time, trouble, and patience. With the Gem Soldering Casket, all the tinware on the place can be kept in order, and made to last, instead of being sent to town, or laid by and forgotten. A set of printed directions accompany the Casket, and with this help, a little practice, and an ordinary amount of Yankee "knack" and determination, almost any man, woman, or child, can do all the soldering of the house and farm. The Casket is a covered box,

containing a Soldering Iron, with copper-head pointed and tinned, a Bar of Solder, and a box of Soldering Salts. We Present the Casket and contents for 2 subscrip-

tions at \$1.50 each, post-paid; OR, will send it, post-paid, to any Post-office in the United States or Territories for \$1.25.

No. 166.—Twenty Tools in One.—Price \$1.00.—The Pocket Tool Holder, which at least one man in every family should possess, is called into requisition a dozen times in the day, whether in-doors or out. It is carried in the pocket, but will serve instead of a whole box of tools, when the latter is not easily obtainable. It is a strong, hollow, wooden handle, with a heavy metal

No. 166.

screw shank, and measures about 6 inches in length, and 1½ inch in diameter at the larger end. The round cap unscrews, and inside are packed some 20 little steel tools—screw-driver, chisels, gouges, brad-awls of different sizes, etc., each of which fits into the clamp end of the handle, where it is held firmly by the metal shank. We Present the Holder and Tools complete for 2 subscriptions at \$1.50 each; OR, supply it for price, post-paid in either case.

No. 167.—Curtis' Rectangular Churn.—Price, No. 0, \$5.00; No. 3, \$9.00.—Many thousands of these churns are in daily use, and they are giving abundant satisfaction. It is claimed for them, that in efficiency, economy and excellence, they are unsurpassed. 5 subscriptions at \$1.50 each will secure No. 0, which is designed for one or two cows. 9 subscriptions at \$1.50 each will secure No. 3, which holds 18 gallons—churns 9 gallons; OR, either will be supplied at prices named. Receiver to pay small freight in either case. We offer these two sizes of these churns; others are made. (See below.)

No. 168.—Hand-Cultivator—"Gem of the Garden."—Price \$5.00.—The working parts of this effective and convenient tool are: 2 Scuffle or Cutting Blades, one 4½ and one 9 inches wide; 2 Plows, right and left-hand; 5 Stirring Teeth, all made of the best steel. The wheel and handles of the "Gem," are adjustable in height, while the frame is so

slotted that the hoes, teeth and plows can be set in almost any position or angle. These implements have given great satisfaction to buyers. 6 subscriptions at \$1.50 each will secure the "Gem" Cultivator; OR, it will be supplied at the price. Carriage in either case to be paid by the receiver. (See below.)

No. 169.—Pruning Knife.—Price \$1.00.—This is a well made Knife for pruning trees, with a blade of reliable quality, and a strong, dark-colored handle. It can be obtained for 2 subscriptions at \$1.50 each; OR, for price; post-paid in either case.

No. 170.—Champion Combination Tool Chest.—Price \$4.00.—Any man or boy will appreciate this chest of tools, and realize the immense saving of time and money effected by having the proper implements always on hand. This chest is not large or cumbersome, yet it contains all the tools necessary for ordinary use. They are 25 in all, including chisels, saws, screw-drivers, gimlets, and a strong, good blade for pruning trees. Each fits firmly into a hard, wooden handle. **Presented for 4** subscriptions at \$1.50 each; OR, sent for price. Carriage prepaid. Very popular Premium.

No. 171.—Farmer's and Housekeeper's Tool Set.—Price \$1.50.—Sufficient for daily repairs in the house, and out-of-doors. Brace, Wrench, Screw-driver, Bits, Gimlets, Nail-set, etc. Made by the Clark Tool Company, and of the best material, and most improved pattern. Securely packed in a strong box. **Presented for 2** subscriptions at \$1.50 each; OR, supplied for price. Carriage prepaid.

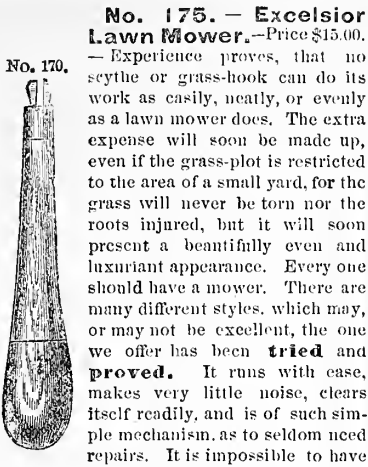

No. 172.—Hand Drill.—Price 60 cts.—An indispensable addition to a set of tools. This useful little instrument—drill stock and six drill points, packed in a box and post-paid, will be **Presented** to any present subscriber who sends 1 new subscription at \$1.50; OR, supplied, post-paid, for the price.

No. 173.—Mathews' Garden Seed Drill.—Price \$12.00.—Its excellence has been proved by many years' use. It is designed for the field or garden. When in operation, it opens the furrow, drops the seed accurately at the desired depth, covers it, and lightly rolls the earth down over it, and at the same time marks the next row. **12** subscriptions at \$1.50 each will secure it; OR, it will be supplied at the price. Receiver to pay freight in either case. (See below.)

No. 174.—Mathews' Drill, Cultivator and Hoe Combined.—Price \$15.00.—A most complete Combined Implement. When used as a drill, it possesses all the features of the separate Mathews' Garden Drill of a smaller size, and will sow all the different varieties of vegetable seeds as well as that, and when used as a Cultivator or a Hoe, it is substantially like the Mathews' Hand Cultivator, or the Wheel Hoe, and is fully equal to either of them. It will be given for **15** subscriptions at \$1.50 each; OR, supplied at the price. Receiver to pay small freight in either case. (See below.)

No. 175.—Excelsior Lawn Mower.—Price \$15.00.—Experience proves, that no scythe or grass-hook can do its work as easily, neatly, or evenly as a lawn mower does. The extra expense will soon be made up, even if the grass-plot is restricted to the area of a small yard, for the grass will never be torn nor the roots injured, but it will soon present a beautifully even and luxuriant appearance. Every one should have a mower. There are many different styles, which may, or may not be excellent, the one we offer has been **tried and proved.** It runs with ease, makes very little noise, clears itself readily, and is of such simple mechanism, as to seldom need repairs. It is impossible to have a thick velvety turf without frequent mowing; the Excelsior turns the work into play. **Presented for 15**

subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay small freight in either case. (See below.)

No. 176.—Lewis' Combination Force Pump.—Price \$6.00.—This is made entirely of brass, and has three feet of hose attached, which will throw a stream of water to a distance of from fifty to sixty feet. As shown in the engraving, it can be converted as desired into a Veterinary Syringe, Agricultural Syringe, or Insect Exterminator; and is invaluable in cases of fire, or for washing wagons, windows, etc. **Presented for 6** subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay small expressage. *

No. 177.—Wood's Patent Corn Sheller.—Price \$3.00.—This is a perfectly simple machine, and will not get out of order if proper care is taken. It consists of a wheel, having upon the surface numerous short, blunt teeth, which remove the corn; a handle by which to turn it; and a spring to adjust the wheels to ears of different sizes. It will shell a whole bushel of corn in four minutes. **Presented for 3** subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay charges for carriage in either case. We will furnish further particulars if desired. Very popular. (See below.)

No. 178.—Griffin Hack Saws.—Price \$1.50.—Indispensable for repairing any farm implement that is

made of iron. The Griffin Hack Saws are of the finest quality steel, and will saw metals more satisfactorily and quickly than they can be cut with a cold chisel. Each saw frame is supplied with a dozen blades. **Presented for 2** subscribers at \$1.50 each; OR, sent for price. Carriage prepaid.

No. 179.—Daisy Garden Plow with Steel Wheel.—Price \$3.50.—This is the strongest, best finished, most satisfactory Garden Plow now made, and being inexpensive, meets the wants of the cultivator. The frame is very light and simple, consisting of but a few pieces firmly bolted together and braced. The wheel has a wooden hub, hickory spokes, and wrought iron tire; the spindle is formed by a short piece of gas-pipe between the double beam, and the whole Plow well finished, striped, and ornamented. It can be used in cultivating all kinds of vegetables, working equally well a bed of onions or rows of potatoes or corn, which no double-wheeled or shovel-plow can do. **Presented for 4** subscriptions at \$1.50 each; OR, supplied on receipt of price. Receiver to pay express charges. *

No. 180.—Acme Pulverizing Harrow.—Price \$25.00.—A defect in our agriculture is the lack of a thorough preparation of the soil to receive the seed. We offer the "Acme" as an implement that not only pulverizes the soil, but crushes the clods and is an effective leveler. It will be seen by the engraving that the implement, instead of the usual spike-like teeth, has a row of double coulters. These are made of the best steel

and bent into such a peculiar shape that, when the implement passes over the surface, these coulters cut, lift, and turn the soil in the most complete manner, leaving it in the condition of a thoroughly prepared seed-bed in a garden. We have watched the improvements that have of late years been made in the "Acme" with interest, and add it to our Premium List in the belief that we place within easy reach of the farmer one of the most effective implements of its kind. Thorough work with the "Acme" will tell at the harvest. **Presented for 36** subscribers at \$1.50 each; OR, sent for the price. Receiver to pay small freight charges. (See below.)

No. 181.—Whitman's Fountain Pump.—Price \$8.50.—Weighs less than four pounds, so that even a child can use it, and save trees, vines, and plants from perishing of drouth. It is made of brass, with a sprinkler and rubber hose attached, and presents a handsome appearance. Serviceable for either farm or garden use, for washing carriages, horses, windows, verandas, etc., etc. No family should be without it. **Presented for 10** subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay freight in either case. (See below.)

Mathematical and Drawing Instruments.

We offer five sets of these valuable instruments, which will be found serviceable not to mechanics only, but to all who have occasion to make exact drawings. There are few persons who will not find use for a case containing dividers, drawing-pens, scales, etc., each article fitting into a special compartment. These instruments, which were very popular as Premiums last year, we are able to offer at still better prices this year.

No. 182.—Price \$5.00.—Is of extra quality and contains 12 pieces, nickel-plated. Handsome rosewood case lined with velvet. **Presented**, post-paid, for 6 subscriptions at \$1.50 each; OR, supplied for price.

No. 183.—Price \$4.50.—A fine Leather Case intended for carrying in the pocket, containing 11 pieces, nickel-plated, extra quality. **Presented** for 5 subscriptions at \$1.50 each; OR, supplied, post-paid, for price.

No. 184.—Price \$3.00.—Another Pocket Case, with leather cover. Very convenient for carrying. **Pre-**

sented for 3 subscriptions at \$1.50 each; OR, supplied for price.

No. 185.—Price \$2.60.—Of very good quality. Instruments made of brass and steel; 14 pieces, including brush and paints. **Presented**, post-paid, for 3 subscriptions at \$1.50 each; OR, supplied for price.

No. 186.—Price \$1.80.—Case of stained wood, containing 9 pieces. **Presented** for 3 subscriptions at \$1.50 each; OR, supplied for price, post-paid.

No. 187.—Box of Oil Colors.—Price \$5.00.—A most complete box of Oil Colors, containing every thing necessary for painting, ready for immediate use. A very handsome and always acceptable present for a lady artist. The colors are of extra fine quality and fitted into a neat case of Japanned metal; brushes, palette, varnishes, stamp, saucers, palette knife, and full set of colors.

Presented for 7 subscriptions at \$1.50 each; OR, supplied for price. Receiver pay small carriage in either case.

No. 188.—"Murillo" Moist Colors.—Price \$1.25.—Sixteen pans of superior quality moist colors, and tubes of Chinese white and sepia; four brushes all packed into a strong box, size 4x8, with a folding cover, and full directions for use of colors. This box will be a delight to all lovers of the art. Only 2 subscriptions at \$1.50 each necessary; OR, we will supply it, post-paid, for price.

No. 189.—"542" Water Color Box.—Price 75 cents.—A very neat wooden case, 6x8 inches in size, containing sixteen cakes of the best imported water colors, two camel's-hair brushes, paint-saucers, copies for painting, etc. This box will afford many hours of pleasure to artists or beginners. We **Present** it, post-paid, for 1 subscription at \$1.50 each; OR, supply it for price.

assorted colors; Pack Fancy Chromo Cards, assorted designs. This valuable Press, with its complete Outfit, is securely packed in a wooden box, 12x5½x5 inches, with grooves for type cases, and a sliding cover. It will be **Presented** for 5 subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay small freight charges in either case.

No. 192.—Commercial Printing Outfit.—Price \$2.00.—By means of this inexpensive printing outfit, the work of a costly rubber stamp can be quickly, easily, and satisfactorily performed. It will be found serviceable for either household or business use, for printing tags, tickets, price-lists, etc. Into a substantial walnut box are fitted: Ten alphabets of solid rubber type, a three-line type-holder, three sets of solid figures, one pair type-tweezers, one bottle Rubber Stamp Ink, one pair Inking Pads, and full instructions for setting type and printing. The *whole* will be sent post-paid for 3 subscriptions at \$1.50 each; OR, supplied, post-paid, for price. Very popular Premium.

No. 193.—Bonanza Printing Press.—Price \$3.00.—A most complete set of printing materials with the Bonanza Press, and full directions by which any person, young, or old, can learn the art for either pleasure or profit. The press is made of malleable iron, japanned in black, with red and gold stripes. The Outfit consists of Composing Palette, two inch Composition Roller, one box Wade's Ink, one set Spacing Reglets, one pack White Bristol Cards, 2A, 3A, font of Fancy Card Type, including Spaces and Quads, which will print a name or a line of type. All packed in a wooden box, and **Presented** for 4 subscriptions at \$1.50 each; OR, supplied for price. Carriage, which is small, to be paid by the receiver.

No. 194.—Combination Linen Marker.—Price \$1.00.—A very useful article in any household. A young person can easily learn to use it, and do the card or linen marking for the whole family. Small card-

board box contains: Metal Linen Marker; a complete font of Type, with Periods, Spaces, etc.; bottle of Printing Ink; a Pad, etc. Full directions for setting type and using. **Presented** for 1 subscription at \$1.50; OR, supplied for the price. Post-paid in either case.

PRINTING PRESSES, ETC.

No. 190.—"Little Gem" Family Printing Outfit.—Price \$1.00.—Any boy or girl can learn to print with this outfit, and spend hours usefully and pleasantly in marking books, letters, envelopes, papers, etc., or printing the names of the family on linen or cards. Five hundred cards can be printed in an hour's time. Directions for use are on the bottom of the box. The "Little Gem" is a beautifully lithographed metal case, containing 150 letters, figures, etc., Solid Rubber Type, a Palette for holding type, one pair Ink Pads, and one bottle Indelible Ink. The whole outfit will be **Presented**, post-paid, for 2 subscriptions at \$1.50 each; OR, supplied, post-paid, for price. A most popular Premium last year.

No. 191.—"Yale" Printing Press and Complete Outfit.—Price \$4.50.—A treasure to its owner. Can be used for printing Address Cards, Tags, Envelopes, Visiting Cards, and for innumerable other

matters. Press No. 2, with Screw Chase, size, 2x3½ inches. The outfit comprises: Full regular font Arabesque Address Type, including capitals and small letters, figures, etc.; Full regular font Ornamental Card Type, with quads and spaces; Three-line Composing Palette for printing one, two or three lines at once; Can of superior black Printing Ink; Composition Inking Roller, with iron handle; Box rich Gold Bronze, for gold printing; Small Type Tweezers for picking up type; Two Type Cases, with hinged lids, and having together 72 compartments; small Lye Brush for cleaning Type; Screw-driver for chase and press screws; Pack Tinted Bristol Cards,

FOR THE YOUNG FOLKS.

No. 195.—Mother Hubbard's Party.—Price \$1.00.—A very absorbing, and perfectly harmless game, and one of which children will not tire. Made entirely of wood, so strongly, and at the same time so simply, that it can not get out of order. It measures 18x5 inches, and stands 10 inches high; can be played on either the floor or a table. Covered with funny pictures in brilliant and beautiful colors—the five smaller ones at the top are not seen at the beginning of the game, but

pop up when the balls are rolled against the pegs in front. A whole family—old persons as well as young—can be amused on a winter's evening with this sprightly game. It will be **Presented for 1** subscription at \$1.50; OR, supplied for the price. Receiver to pay small expressage in either case.

No. 196.—Spring Bagatelle.—Price \$1.50.—Nearly every one knows this very pretty and fascinating game. Old as well as young persons are amused by it, and it serves to pass away a winter's evening pleasantly. It has one bell, and is well made. The game is for the players to take turns in shooting the Ball (by means of the spring), sending it in between the Pins and under the arches, until the sum of 300 is made. It will be **Presented for 2** subscriptions at \$1.50 each; OR, supplied on receipt of the price. Receiver to pay expressage (which is not large), in either case.

No. 197.—Sloop.—Price 50 cts.—The Little Boy's Favorite is thirteen inches long from stern to bowsprit, and can not sink. Painted in bright scarlet, has a strong mast, and linen sails, with brass rings, etc. This trim little craft will be **Presented for 1** subscription at \$1.50; OR, sent for the price. Post-paid in either case.

No. 198.—Game of Loto.—Price \$1.00.—This very popular game can be played by any number of persons, and is entertaining to both young and old. The cards measure 6½x4 inches, and are stamped distinctly in black and green. The numbered pieces, which are of smooth wood with purple figures, are contained in a neat bag, and the glass markers in a special compartment. Full directions for playing accompany the game. The whole is packed in a strong lithographed box of peacock blue, with decorated cover. It will be **Presented for 2** subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case.

No. 199.—Dominoes.—Price 60 cts.—Patent embossed black Dominoes, with white spots. Though inexpensive, they are very durable, and not in the least trumpery looking, and are made by machinery, therefore exact. Fitted into a bright-colored lithographed box, and accompanied by full instructions for the following ten varieties of this popular game: Block, Draw, Muggins, Bergen, Ronnee, Enchre, Poker, Bingo, Matador, and Tiddle-a-Wink. **Presented for 1** subscription at

\$1.50; OR, supplied for price. Post-paid in either case. These Dominoes are exported to Europe in large quantities.

No. 200.—Top and Chimer.—Price 50 cts.—A beautiful "Coral" Humming-top, nearly six inches high, and twelve in circumference. Made of brightly colored metal, with a coral-wood handle, and a metal ring. Also a Rattle Chimer, with a clear, loud bell.

Made entirely of galvanized iron, very strong; can be heard at a long distance, and will answer the purpose of a call-bell, signal, or a toy for children. These two articles will be **Presented for 1** subscription at \$1.50, OR, supplied for the price. Post-paid in either case.

No. 201.—Toy Cannon.—Price \$1.25.—This fine, strong field-piece for real firing on the "Fourth," etc., or for playing soldiers, measures 9½ inches from end to end; wheels 4 inches high. It is made entirely of iron, painted black, except round the mouth, where it is bright red. The gun moves on a pivot up and down. It will be **Presented for 2** subscriptions at \$1.50 each; OR, supplied for price. Receiver to pay small express charges in either case.

No. 202.—Smaller Cannon.—Price 75 cts.—This little cannon is exactly similar to the preceding, except in size and price. It measures 6½ inches in length, and the wheels are 2½ inches high. It is light enough to be carried in the pocket, and will make plenty of noise when fired. **Presented for 2** subscriptions at \$1.50 each; OR, supplied on receipt of the price, postage prepaid in either case.

No. 203.—Foot Ball.—Price \$1.50.—A splendid ball for the boys. Made of good quality India rubber, strong and durable. Size No. 2 measures eighteen inches in circumference, and has a short metal tube. Any boy who sends us 2 subscriptions at \$1.50 each, may have this fine premium; OR, it will be sent for the price. Postage prepaid in either case.

No. 204.—Steel Magnet.—Price 60 Cents.—Amusement and Instruction Combined.—This premium will be found a source of endless amusement and instruction to young people, for when they have tried all the experiments here described, they will take pleasure in inventing others, and will be, at the same time, learning something of the wonderful science of Magnetism. The Magnet is horse-shoe-shaped, and has a soft iron bar called an Armature (a), which is to be removed when the Magnet is in use.

We give directions for a few of the curious experiments: If the Magnet is bent out straight, and hung up by the middle, the end marked N will always turn to the North. Rub the blade of a pen-knife on the Magnet, and the knife will become magnetic, i. e., it will attract metals just as the Magnet does. Rub two knives on different arms of the Magnet, and the knives will cling together fondly if held near each other, but when rubbed on the same arm, the knives will not take any notice of each other. Rub a knife-blade or any piece of hard steel on the Magnet, and it will pick up needles, small nails, tacks, etc. Any intelligent boy or girl will find great amusement in these strange actions, and even grown up people will be amused and instructed by the Magnet. No family should be without one. We will send, post-paid, a very good 6-inch one (bar 13 inches long, weight 11 ounces,) for the price; OR, **Present** one to any boy or girl for 1 new subscriber at \$1.50, post-paid.

No. 205.—Eclipse Steam-Engine.—Price \$1.00.—Four and a half inches high, with a brass boiler, a lamp, and two speeds to belt pulley. This engine is of sufficient power to run toy or model machinery, and will please intelligent lads. It will be **Presented for 2** subscriptions at \$1.50 each; OR, supplied for the price. Post-paid in either case.

No. 206.—Boy's Bicycle.—Price \$6.00.—A never-failing source of delight to a boy is a strong, durable, well-made Bicycle. The one we offer possesses all these characteristics; it has a 32 inch front wheel,

tinned iron frame and seat, and shaved-spoke wheels. Suitable for a boy from 10 to 14 years of age, and will not fail to make him happy. **Presented for 7** subscriptions at \$1.50 each; OR, furnished for the price. Receiver to pay freight charges in either case.

No. 207.—Child's Swing.—Price \$1.00.—A delight to the little ones. Amuses them for hours at a time, and keeps them out of danger and mischief. An inexhaustible source of pleasure, so strongly made that that it will last for years, the only part to wear out being the ropes, which are easily replaced. Perfectly safe, as the child cannot possibly fall out, and can keep himself in constant motion. The seat has a soft, comfortable cushion, covered in pretty, bright-colored cretonne, and studded with brass-headed nails. The back, front and

sides are of walnut, sliding up and down the ropes, for convenience in getting into the swing, and for carrying it about. Several yards of rope, and two steel rings are included, and the whole swing is ready for immediate use, requiring only to be put up. It can be hung from the branch of a tree, the roof of a veranda, or in a door-way, where it will be invaluable for amusing the little ones in bad weather. No family of children should be without at least one of these delightful swings. Even the baby can be trusted to it, and it is strong enough to be used by a child eight years old. **Presented for 2** subscriptions at \$1.50 each; OR, sent for price. Receiver to pay small expressage. (See below.)

No. 208.—Doll's Perambulator.—Price \$1.50.—Something for the little girls. This Doll-carriage is made of willow-ware, prettily lined, and the wheels measure 6 and 8 inches in diameter. There is a long

handle at the back, and a movable parasol canopy for the waxen baby's protection from the sun. **Presented for 2** subscriptions at \$1.50 each; OR, furnished for the price. Receiver to pay small express charges in either case.

No. 209.—"Tally-Ho" Sulky.—Price \$8.00.—This velocipede furnishes very healthful exercise, and was, for this reason, awarded a diploma of merit by the New Jersey State Agricultural Fair of 1882 (Sanitary Department). It is driven by the arms and steered by the feet, and is always popular among the little boys and girls. The one we offer is suited to a child from 4 to 10 years of age, and moves easily, but with great speed, is well and strongly made, and highly ornamental. It can be used in the house as well as out of doors, and so furnish amusement to children in bad weather as well as fine. **Presented for 8** subscriptions at \$1.50 each; OR, supplied for price. The small expenses of freight to be paid by the receiver in either case. (See below.)

No. 210.—Horizontal Engine.—Price \$2.50.—This engine is packed in a strong box, with a lamp, funnel, etc. It is six inches long, and four and a half inches high; has a brass boiler and safety-valve, a brass pipe connecting the boiler with the steam-chest, one-inch stroke, cross-head running on steel ways. It will be **Presented for 4** subscriptions at \$1.50 each; OR, supplied for price. Post-paid in either case. Popular Premium last year.

No. 211.—Boy's Sled.—Price \$2.00.—This fine sled is nearly a yard (33 inches) long, and twelve inches wide. It is made of oak wood, varnished, and prettily decorated, has bright tin braces, arched knees, and polished runners. It is worth any boy's while to secure this beautiful premium by sending us **3** subscriptions at \$1.50 each; OR, we will send the sled on receipt of the price. Small expressage to be paid by recipient in either case.*

No. 212.—Lion Savings Bank.—Price \$1.50.—An amusing group. A coin is placed in the old monkey's paw, and when the spring is touched, the baby monkey leaps up and throws the money into the lion's mouth, which opens at the same instant. Bank unlocks

underneath; painted in bright colors. Will be **Presented** to any one who will send **2** subscribers at \$1.50 each; OR, will be supplied for the price. Receiver to pay small expressage. (See below.)

No. 213.—Boy's Wagon.—Price \$5.00.—This Express Wagon will delight the small boys, and help them to be useful, by carrying parcels, etc., for their elders. It is strongly made, with a long handle, heavy round tire wheels, an iron axle, hub-caps, and a firm seat. The body is 28 inches long, well painted, and decorated, with its name on both sides. A sensible present to a little boy at any time of year. **Presented for 7** subscriptions at \$1.50 each; OR, supplied for the price. Receiver to pay small expressage in either case.*

School Bags for Boys and Girls.

No. 214.—Patent-Leather Bag.—Price 60 cents.—A very pretty Bag that can be worn by either a girl or a little boy. Made of black patent-leather, figured; bound with tan-color, fastened with a strap and buckle, and lined with mouse-color lineu. It has a long patent-leather strap with a buckle, for wearing over one shoulder. Measures 11x6 1/4 inches inside. Will keep the books dry and safe. **Presented for 1** subscription at \$1.50; OR, sent for the price. Post-paid in either case.

No. 215.—Another Water-proof Bag.—Price 30 cts.—This Bag is a little smaller than the preceding, and so soft and light, that, when empty, it can be folded up and carried in the pocket. Made of black, oiled cloth, bound with black braid, has a metal clasp, and a pretty shoulder strap of red, white and blue. **Presented for 1** subscription at \$1.50; OR, sent on receipt of the price. Post-paid in either case.

No. 216.—Large School Bag.—Price 50 cents.—Made of black oiled-cloth, with tan-color binding, and long shoulder strap. Steel buckle, etc. Is perfectly water-proof, and large enough (13x10 inches) to hold all the books, including the big Geography. A strong and fine-looking bag for a boy or girl, when empty it can be rolled up with a small parcel. **Presented for 1** subscription at \$1.50; OR, sent for the price. Post-paid in either case.

No. 217.—School Set.—Price 75 cts.—A delightful premium for the boys and girls. Three prizes in one; no child should be without them. First, a school-bag, eighteen inches across, made of knitted twine, very strong and neat-looking; second, a painted tin case, or

Scholar's Companion, with a lifting cover, and holding a sponge, lead pencil, slate pencil, pen holder, ruler and chalk, each fitted to a special compartment; third, a "crystal book-slate," 10 by 13 inches when open. Any child may secure this fine triple Premium by sending **1** new subscription at \$1.50; OR, it will be sent for the price. Post-paid in either case. Popular Premium.

INVALUABLE ON EVERY FARM.

AN ELEGANT
GUN

—FOR—
Everybody.

No. 218.—Remington's Double-Barreled Breech-loader.—Price \$45.00.—If you want the **BEST Gun** now made in this country, then we can give you the **Famous New Model Remington Double Barrel Breech-loading Shot Gun**. This Gun has the celebrated **Scott Pattern Top-Lever Action** (universally pronounced the best action ever produced), together with the Double Bolt, Rebounding Locks, large Head Strikers, Patent Fore-end and Extension Rib. The Barrels are of the finest quality of Decarbonized Steel, and the Stock is of selected Walnut, finely finished, with Pistol Grip checkered. Every one of these Guns is **Choke-bored**, and is thoroughly tested at the factory. Weight: from $8\frac{1}{2}$ to 9 pounds. **We can from our own personal experience pronounce this Gun superior to any other in the market.** It is practically a **complete and perfect Gun**. Mr. Judd uses this gun every autumn with the greatest satisfaction. A very popular premium last year.

This **Superb Fire-arm** you can secure **free of cost** by sending us **55** subscriptions to the *American Agriculturist* at \$1.50 each; OR, we will furnish the same for the price. Receiver in either case to pay carriage.

What our Patrons write us about this Gun.

MELROSE, Minn., Dec. 29, 1883.

The Famous New Model Remington Gun is entirely satisfactory. F. L. SMITH.

CALLSVILLE, Fla., Dec. 3, 1883.

I find the Famous New Model Remington Gun to be a superior one in every respect. I have killed Quail on the Wing at **Sixty Yards**. Yours truly, E. M. LANBERT.

No. 219.—Double-Barreled Breech-loader.—Price \$49.00.—If you want a **Superior Breech-loader**, we can furnish the **W. Scott (Belgian) Gun**. This Gun we selected especially for our readers, and after many thorough trials, can pronounce it the **best weapon** for the money now obtainable. It gives **universal satisfaction**, and both for **close and strong** shooting is equal to many of the Guns sold at double and treble its price. The barrels of this Gun are of **Fine Laminated Steel**, have been **thoroughly tested**, and are **absolutely safe**. The action is the celebrated Lefancheaux pattern, which for both **reliability and wear** is **incomparably superior** to any side lever action now made.

Mr. Robert B. Roosevelt, the veteran sportsman, says in his volume, just published, entitled "Florida and the Game Water-Birds": "I may say, that no guns could have been more severely tried than mine that were manufactured by Lefancheux, one of which was the second that was ever permanently used in this country, and that they have never given out in their working parts, while the oldest and most hardly used has never given out at all, although shot in all weathers, and under the most trying circumstances."

The celebrated "**Stoucheuge**," the recognized authority in Europe, says in his new work, "The Modern Sportsman's Gun and Rifle": "This Lefancheux Action has maintained its ground as one of the strongest of all those known to gun makers."

This Gun has Steel Freed Locks, and the stock is of solid Walnut, oil-finished, and full checkered. We can furnish either 10 or 12 bores, 30 or 32-inch barrels—weight from 8 to 10 pounds. This most excellent Gun will be sent as a **free gift** to any one sending us **25** subscriptions to the *American Agriculturist* at \$1.50 each; OR, we will forward it for the price. Receiver to pay carriage.

N. B.—If you desire any other Make, Quality, or Style of GUN, RIFLE, or REVOLVER, or in fact anything in the line of Sportsman's Supplies, from a Paper Cartridge to a Hammerless Damascus Breech-loader, either as Premiums or otherwise, please write us, stating full particulars. Also, write us as to cost of freight or express on any desired gun.

Address

ORANGE JUDD CO.,

DAVID W. JUDD, Pres't.

751 Broadway, New York.

What our Patrons write us about this Gun.

SALEM, Va., Jan. 10, 1884.

W. Scott Gun received, have fully tested it, and am much pleased. Yours truly, J. WM. BUSHONG.

BEAUFORT, S. C., March 25, 1884.

I am satisfied with the W. Scott Gun, it shoots remarkably well. Yours respectfully, B. B. SAMS.

ATLANTIC CITY, Jan. 17, 1884.

W. Scott Gun received. Have tried it, and report: well satisfied. Yours respectfully, J. WOOTTON, JR.

FLAG SPRINGS, Mo., Jan. 8, 1884.

The W. Scott Gun arrived safely and gives good satisfaction—compares well with Gun of twice its cost. J. M. SHEPARD.

BUTLER, Ky., Jan. 15, 1884.

Received the W. Scott Gun in due time; have tested it; proves to be a **strong and accurate** shooter; am well pleased with it. Yours truly, C. A. WANDELOHR.

FORT COLLINS, Colo., March 9, 1884.

W. Scott Gun at hand all right. Two weeks ago, on trial, threw Buckshot 250 yards. Yours truly, H. T. MILLER.

DANBURY, Conn., Dec. 26, 1883.

The W. Scott Gun came to hand all right, and upon trial I find it to be a strong shooter. One of my neighbors has a \$75.00 Parker Gun, but he cannot beat this W. Scott in shooting. Yours truly, S. J. SHERMAN.

No. 220—"Handy" Gun.—Price \$4.50.—If you want an inexpensive Gun, we can recommend our **Handy Gun**, a **single barrel Muzzle-loader**. These Guns were made at the World Renowned Springfield Armory, were **thoroughly tested** in all

DISTANCE THIRTY YARDS, FIRED WITHOUT REST.

W. Scott Gun.

"Handy Gun."

parts, and bear the Government Inspector's marks, **guaranteeing the perfection**, both of **materials and workmanship**. The barrel is of **solid steel** of the **finest** quality, and is 32 inches long; the lock is of the same material, and the stock is American Walnut, oiled. This Gun we will **Present** to any one who sends us **6** subscriptions to the *American Agriculturist* at \$1.50 each; OR, we will supply it for the price. Receiver to pay carriage.

What our Patrons write us about this Gun.

GROVEPORT, Ohio, March 31, 1884.

The Handy Gun came all right, and is all we claim it to be. Yours truly, JOSEPH S. LEIGH.

MANCHESTER, Mich., Jan. 4, 1884.

The Handy Gun you sent me I have received in good order, and am well pleased with it. Yours, HENRY SCHULTE.

OLD CHATHAM, N. Y., Jan. 18, 1884.

Handy Gun received. Am well pleased, think it a good article for the money. C. A. CASE.

REILEY SPRINGS, Texas, Jan. 21, 1884.
The Handy Gun came in good time and order. Am well pleased with it. Respectfully, R. H. CALDWELL.

No. 221.—Rifles.—Price \$26.00.—For **Hunter's or Sportsman's** use, the best single shot Rifle now made is unquestionably the celebrated **Remington Improved Creedmoor Rifle**, Hepburn's Patent. This superior fire-arm is equally well adapted for long range shooting or general use as a Hunter's and Sportsman's Rifle. It is the safest, most durable, and most accurate Rifle now obtainable. It has a solid Breech-block, with direct rear support, side-lever action, Rebounding Hammer, and Trigger always in the safety notch, thereby rendering premature discharge impossible. It can be had in 38, 40, or 45-Calibre, 28-inch Barrel with Pistol Grip. This Rifle will be **Presented** to any one sending **35** subscriptions at \$1.50 each; OR, we will supply it for the price. Receiver to pay carriage.

No. 222.—Revolver.—Price \$2.50.—A reliable 32-Calibre Revolver. Genuine Steel Barrel and Cylinder. Well made, durable, and safe. Will be sent, post-paid, on receipt of **3** subscriptions at \$1.50 each; OR, we will furnish same, prepaid, for the price.

No. 223.—Double Action Revolver.—Price \$5.00.—A new, first-class Double Action Self-Cocking Revolver, nickel plated. One of the latest and best now in the market. With rubber stock finely finished. This is a most desirable Premium, and can be secured, free of charge, by sending us **6** subscriptions at \$1.50 each; OR, we will supply it, prepaid, for the price.

No. 224.—The New Victoria Combination Gun Case.—Price \$3.50.—This is the popular Victoria Gun Case, with Cartridge Bag, and separate pocket for Cleaning Implements attached. It is made of selected, Water-proof Canvas, Leather Covered Tip and Ends, with two straps to fasten the barrel by the side of the stock, thereby making a compact and easily carried package. Heretofore three separate bags were required, but now we can furnish the three in one, as above, and all Hunters and Sportsmen will appreciate the advantage. **5** subscriptions at \$1.50 each will secure this desirable Premium, post paid; OR, we will send it, free of charge, on receipt of price.

No. 225.—Reloading Implements.—Price \$2.00.—**Something Entirely New.**—A complete set of Reloading Implements, consisting of a combined Powder and Shot Measure, Loader and Decapper, Recapper, Shell Crimper (or Turn-over), Shell Extractor, Cleaning Rod in three joints, with Expansive Felt Swab, Wire Scratch Brush, and Slotted Tip, making in all **12 separate pieces** of first class materials, handsomely finished, and compactly put up in a strong pasteboard box. As a Reloading Outfit is an absolute necessity with every Breech-loading Shot Gun, we deem this a most desirable premium, and at the price it certainly is a bargain. Only **3** subscriptions at \$1.50 each are required to secure this valuable Premium, post-paid; OR, we will send it, prepaid, for the price.

SCROLL SAWS.

No. 226.—Scroll Saw.—Price \$3.00.

"The Prize Holly."

The beautiful Swiss looking articles, for both ornament and use, made with the Scroll Saw, are familiar to many persons, as this machine has lately come so much into vogue. No more acceptable present to a friend could be thought of than a pretty article of one's own manufacture, in wood, tortoise-shell, horn, etc. For young persons especially, this work is a fascinating pastime, though by no means beneath the notice of their elders. The "Prize Holly" Saw is superior to many others in ease of working, and excellence of finish. It has an improved Clamp for holding the blades firmly; a Tilting Table, an Emery Wheel, and a holder for drills, making it very complete. Its weight is only thirty pounds, and its simplicity is such, that it is very easy to set up and operate.

DIMENSIONS AND CAPACITY.

Height of machine, 30 inches; width, 18 inches; diameter of Balance Wheel, 12 inches; weight 7 pounds. Saw swings 20 inches in the clear; stroke, $1\frac{1}{2}$ inch. Lathe-bed Ways ground and polished. Given for 4 subscriptions at \$1.50 each; OR, sent on receipt of the price. Receiver to pay the small freight.

No. 227.—Combined Lathe and Scroll Saw.—Price \$8.00.

"The Demas Prize."

Adepts in the art of scroll sawing, have long wished for an attachment with which to turn certain small, delicate articles, for ornamental work. This can be done most readily with a lathe, and the "Demas Prize" Combined Lathe and Scroll Saw, will be found to supply the want most effectually. The saw is an excellent one, and being mounted on the heavy frame requisite for the lathe, it works with perfect steadiness. All its parts are well finished, and by its use, an infinite variety of graceful and elegant articles can be produced. The following measurements show

The Capacity of the Lathe and Saw.

Height from floor to top of Lathe Bed, $27\frac{1}{2}$ inches; to Centres, 30 inches; to top of Saw Table, 32 inches. Length of Lathe Bed, $24\frac{1}{2}$ inches; it will turn a piece 16 inches long and 5 inches in diameter. Diameter of Balance Wheel, 14 inches; weight 11 pounds.

Stroke of Crank, 4 inches; size of Lathe Spindle, $\frac{7}{16}$. Short Rest, 4 inches long; Long Rest, 12 inches long. Stroke of Scroll Saw, $1\frac{1}{2}$ inches; it will cut $1\frac{1}{2}$ inch thick if necessary, but 1 inch practically, and swing 20 inches in the clear.

It has Tilting Table, which is ground and polished; the ways to Lathe Bed are also ground and polished—in fact, it is so finished that it will do just as fine work and just as satisfactory as any \$50.00 Lathe and Saw.

Chucks for holding Drills, etc., can be attached. Weight, 50 pounds.

An Emery Wheel, Drill, and Turning Tools accompany the combined machine.

A CIRCULAR, or BUZZ SAW, for rapid sawing in a

straight line may be attached to the Lathe, at a slight increase of cost. The saw is $3\frac{1}{2}$ inches in diameter, and will find many useful applications. 9 subscriptions at \$1.50 each, will secure this machine without the Buzz Saw attachment; OR, for 11 subscriptions at \$1.50 each, we will send the machine and attachments complete; OR, will supply either for the price, which is \$8.00 and \$9.50 Receiver to pay small freight charges.

** SPECIAL PREMIUM. **

No. 228.—Wood's Penograph.

Price \$3.00.

The Perfection of Fountain Pens.

Totally unlike other so-called Stylographic pens, which have a perfectly rigid point, incapable of making any shaded lines. An ordinary gold or steel pen is used in this holder, which contains ink sufficient to last all day in constant use, and it can be safely carried in the pocket. The pen needs no wiping and no dipping for ink. **Wood's Penograph** is a strong and handsome looking gutta-percha holder with gold mountings, and a first-class diamond pointed 14-carat gold pen. It measures $6\frac{1}{2}$ inches when open and ready for use, and is unconditionally warranted to give satisfaction. Hitherto, a really desirable two-nibbed gold pen and fountain-holder has been an expensive luxury, in which comparatively few people could indulge, but we now place Wood's Penograph within the reach of every reader of the *American Agriculturist*. Having several of these pens in our office in constant use for wrapper writing, etc., we are able to judge of their merits, and we hope that every one of our readers will become the possessor of one of these ingenious and reliable articles. Any subscriber who immediately renews his subscription for one year (in addition to the term already paid for), may obtain the Penograph by inclosing \$1.50 additional—\$3 for both. We also offer the *American Agriculturist* for one year and the Penograph for only \$3.00. Also, the Penograph will be sent as Premium to any one who sends us 3 new subscriptions, post-paid in any case. Should it fail to give perfect satisfaction, it may be returned or exchanged for another article on our Premium List.

WONDERFUL PROSPERITY OF THE American Agriculturist. WHY?

Because of our steady adherence to the rules and regulations laid down over thirty years ago, viz.:

1st.—To employ the ablest Editors and Contributors, those of wide information and experience.

2d.—To get the best reading matter without regard to expense, and adapt the paper to all sections.

3d.—To always look after the wants and circumstances of those struggling with limited means.

4th.—To exclude from its business pages all advertisements of quackery, medicines, and unreliable advertisers. (Probably not three other Journals in the whole country, admitting advertisements at all, have laid down and persistently and constantly adhered to so strict rules in regard to inserting only good advertisements.)

5th.—To make its teachings PLAIN and PRACTICAL as well as reliable, and use the ENGRAVER'S skill wherever it will add to the value of the articles and to the pleasure and interest of the readers.

6th.—To devote much attention to protecting its readers from SWINDLING SCHEMES. Few numbers have been issued in a score of years, and more, that have not had exposures of "Sundry Humbugs." There is abundant evidence that in this way alone the *American Agriculturist* has saved to its readers, in the aggregate, AT LEAST FIVE TIMES AS MANY DOLLARS as they (the readers) have ever paid into the subscription fund.

1842. * Onward ! Upward ! * 1885.

What the *American Agriculturist* has been and is to-day, it shall be and much more during 1885. Last June we began a series of changes and improvements which have made the *American Agriculturist* more acceptable than ever to the public, and a marvel to other publishers who have asked in surprise, how we could furnish so much original matter and so many engravings for the money. These changes and improvements will continue to go on. Our vast circulation and advertising patronage enables us to promise this.

Trustworthy Houses

In the following list will be found the name of **Firms, Individual Houses and Manufacturers** whose liberal arrangements with us for our Premium Articles, enable us to make these very favorable offers to our readers, and whose reputation is in itself an assurance of the good quality of all these articles.

S. S. WOOD "Penograph" Pen, 134 $\frac{1}{2}$ W. 33d st., N. Y.

* KIND * WORDS. *

The following are sample expressions of opinion regarding the *American Agriculturist*, which we are constantly receiving.

WEST SALEM, Wis.
"Your paper is the best I have ever read."
DRAYTON M. JOULD.
BOSTON, MASS.
"Your paper improves with each number."
WALTER E. THWING.
COLLINS CENTRE, N. Y.
"Have taken the *American Agriculturist* several years, and like it very much."
W. S. POTTER.
DECORAH, IOWA.
"As for the *Agriculturist*, it is all I wish, and gets better every year."
JOS. BONELAND.
WITOKA, Minn.
"It is the only reliable farm journal; no farmer's home should be without it."
MARY C. NIEMAN.
HUTCHINSON, Kan.
"I consider one copy pays a farmer many times for a whole year's subscription."
H. HARTFORD.
DOVER, Maine.
"Having been a subscriber for years, I expect to be as long as life lasts."
JAMES B. COCHRAN.
REDFIELD, Kan.
"I like the *American Agriculturist* better than any paper that I ever read."
H. KOCH.
HYCOCK, La.
"I think the *American Agriculturist* is the best paper in the country."
GEO. LEWIS.
COUNCIL GROVE, Kans.
"I like your journal ever so much, and intend to be a permanent subscriber."
C. E. MERCHANT.
ETNA, Wis.
"I have not missed a number since I commenced taking it in 1867."
J. H. CLARKSON.
EASTON, Md.
"I would sooner miss my dinner, than the number of the *American Agriculturist*."
JOSEPH LONGENECKER.
WINCHESTER, Va.
"All the numbers have been received, and I am delighted with them."
HELEN J. STROTHER.
PORTLAND, Oregon.
"Although I am not an agricultural man, I think I cannot do without your paper."
W. F. RODOLF.
GALLAGHER RANCH, Medina Co., Texas.
"Your worthy journal has become quite a favorite in my family. I would not dispense with it for anything."
MRS. ELIZA HINERSATH.
WEST MIDDLESEX, Pa.
"I have taken your paper since 1867, and could not think of doing without it."
C. H. MITCHELTREE.
SOMERTON, Pa.
"I would not do without it now; and it is a first class book. I am much pleased with it."
A. F. FISHER.
MALVERN, Ark.
"I think the paper sufficiently worth the subscription price without a premium."
LOUIS GUESINEAN.
DURAND, Wis.
"I intend to have the *American Agriculturist* as long as it or I continue to exist."
W. E. ALKIRE.
DANBURY, Conn.
"Of all the Agricultural papers I have sampled, I think the *Agriculturist* is far ahead of any."
JNO. A. MONAHAN.
ELLIOTT, Iowa.
"We do not think we could keep house without the dear old *American Agriculturist*. Long may it live."
OSCAR M. PHILLIPS.
BLOOMINGTON, Neb.
"I like the *American Agriculturist* better than any paper of the kind in the United States."
F. M. VANCE, Co. Supt. of Pub. Instruction.
WAMPUM, Pa.
"I feel satisfied you are the most reliable publishing firm I know of to expose Humbugs, Swindles, etc."
JOHN H. JENKINS, JR.
SOUTH BEND, Ind.
"Mr. J. Allshouse says he has received his numbers regularly, and has not lost or missed a number in sixteen years."
R. S. TOWNSEND.
PORT KENNEDY, Pa.
"I have received six numbers of your *American Agriculturist*. It is a splendid paper, and am well pleased with it."
MARTIN McHALE.

WEST NEW BRIGHTON, S. I., July 12, 1884.

"The *American Agriculturist*, under the new management, editorially, and typographically, is certainly a superb journal."
J. S. NEYLE, *Staten Island Star*.

DECORAH, IOWA.
"The Pictures you have given are splendid. As for the *American Agriculturist*, it is all I wish, and gets better every year."
JOSEPH BOMLAND.

EVANSTON, Wyoming.
"I am just in receipt of the number sent me, and it is like meeting a cherished old friend to see the *American Agriculturist* again."
J. VAN A. CARTER.

GRANTSVILLE, Md.
"Many thanks for the kind letter you wrote me. I have no complaint to make, but I expect to take your paper all my life."
J. HANDWERK.

FAULKTON, Neb.
"It has always been my favorite journal, and think it is bound to 'Stand at the Head,' under its present management."
R. G. NEWTON.

HARDTIMES LANDING, La.
"I cannot do without it, as it is my favorite out of all my papers I take. I would not do without it for ten times its cost."
T. S. MONTGOMERY.

NEW CANEY, TEXAS.
"I wish to say that this year (1884), is my first acquaintance with the *American Agriculturist*, and that I am much pleased with it."
MR. JOHN BOWEN.

CAMP PAROLE, Md.
"You would have heard from me sooner, but it took some time to read and compare sample numbers with other journals, which I did, and found that I like yours better than any other."
GEO. E. MORAN.

PITTSBURGH, Penn.
"I paid for a subscription to your paper last year, for my father in Scotland. He says it is the best paper he ever read, and wants me to send it to him again."
JOHN MORRISON.

WASCO, Oregon.
"I was a subscriber for sixteen or eighteen years in Canada, but for the last four years I have been knocking through the world, and have finally landed here, and feel lost without the *American Agriculturist*."
JAMES GRAY.

SUPERIOR, Wis.
"Allow me to say that I am very much pleased with your paper. Although not a farmer, I find a great deal that is of interest to me. I think every farmer ought to have it, whether he has forty acres or a thousand."
C. E. A. STANLEY.

WOODBURY, Tenn.
"The present volume, eight numbers of which have just been received, have been read with much interest by me, and I believe the *American Agriculturist* to be the Prince of Agricultural Journals."
WARREN NEWMAN, Editor & Pub. "Cannon Courier."

WHITE LICK, Ind.
"You may put me down for a life member of the *American Agriculturist*. I have found enough in one number to pay for a year's subscription. I am in the Poultry business, and will give you some experience in the business some time this summer."
JERRY CARTER.

"The *American Agriculturist* is one of the oldest and most reliable publications of its kind in the country. Recent improvements have still further increased its value."—Wooster (O.) *Arcanum Journal*, July, 1884.

Mr. Henry F. Moore, F. C. S., the agricultural editor of the "Times," in a congratulatory communication to the Publishers of the *American Agriculturist*, says: "It is a capital paper."

"The Frome (England) Times and Agricultural Journal" for the Counties of Somerset, Wilts, and Dorset, says: "The *American Agriculturist* for July, 1884, is the most superb number of that periodical issued in its 43 years of existence. This is the best and most home-like agricultural paper published, and ought to have a large sale in this country" (England).

"The London Morning Post," No. 39,947, over a century old, and one of the leading papers of the Old World, thus pleasantly alludes to this journal: "We learn that with the July part of the *American Agriculturist*, Mr. Joseph Harris will attach himself to the editorial staff of that journal. One of the pleasantest of agricultural writers, and with the knowledge that an education at Rothamsted must give, this gentleman is to be congratulated on renewing his connection with the journal that has more of the ring of the domestic hearth than any other Agricultural Journal in the world."

To Bee-Keepers. Watson's Standard Bee-Hive

is the only one in the world that is an absolute safeguard against loss in swarming, and the only one in which swarms can be sent in perfect safety to any point in the country, in any season of the year. Send for Price List and full Descriptive Circular, etc.

LEFFEL'S IMPROVED IRON WIND ENGINE
The lightest, strongest and easiest regulated **WIND ENGINE** in the world. Send for Circulars to the **SPRINGFIELD MACHINE CO., Springfield, O.** All Working Parts made of Malleable Iron.

HERCULES WIND ENGINE.

The principles of a Turbine applied to a Wind Motor. We desire to call attention to the following extracts from a private letter, illustrating the superiority of the Hercules
"My ten-foot Hercules drives a 12-inch Burr mill, elevates all my grain, besides pumping all water for my stock. I was grinding corn to-day, the grinder making about 1,000 revolutions per minute, when a man came in, and after looking at the meal, asked if it was bolted it was ground so fine. It operates in a very light breeze. All who have seen it, pronounce it the finest thing they ever saw. It is placed inside the cupola of my barn. Yours very truly,
JAMES HOSTLANDER,
N. Ridgeville, Lorain Co., Ohio.
Illustrated Catalogues mailed to all who enclose stamp. Address,
HERCULES WIND ENGINE CO., Worcester, Mass.
Mention this paper.

CHAMPION Wind Mill.
No New Departure.
Uses no parts, joints nor special devices, not necessary to make a perfect self-governed Wind Mill, that will run in any kind of storm and stay on the tower as long as the tower stands, and stop, and stay stopped, when you want it still. No unsightly vane. No brake to stop the wheel. No springs for any purpose. No stop pins, clutches, nor bumpers to strike. Nothing complicated to get out of order. No thin sheet iron to rust out. No rough wearing part to wear out, and no make-shift anywhere in its construction. The **Champion** is no untried experiment. It is handled by the best of dealers, and gives the best of satisfaction to them and their customers. It is, as for years it has been, the leading Wind Mill in the market. Send for catalogue of **Champion Wind Mill, Iron Pumps, Star Wood Pumps, Tubing, Tanks, Cisterns, etc.** Good agents wanted in territory unoccupied.
POWELL & DOUGLAS, Waukegan, Ills., U. S. A.

Grand River Institute, Austinburg, O. 52 yrs. old. Academic, Music, Normal, Com'l, and Telegraphy. Board and Tuition, \$37 per 13 weeks. Students may enter any time. **REV. E. B. WEBSTER, A. M., Principal**

THE GREAT WEST

During past years the "American Agriculturist" has been a most important agency in settling up the rich, fertile lands of the Great West and Northwest. We have always urged our readers to migrate Westward, where with free homes and cheap homes, they should find material prosperity and happiness. Dwellers in Kansas and Nebraska alone, who went thither in accordance with our advice, are

NAME.	Post Office Address.	Character of Land.	Gov't land.	Improved Land, p. a.	Price of Wild Land.	Any Railroads near you?

PHOTOGRAPHY AT HOME.

\$5

The Science of Photography has made greater strides toward perfection in the past five years than during any period since the invention of the Duererotype, which was the beginning of practical photography, and it is to the invention of the prepared Instantaneous Dry Plate that much of the improvement is due. The employment of dry plates dispenses with cumbersome apparatus, and enables the amateur to do what required months, if not years of study and apprenticeship to attain under the old system. It is a mistake to suppose that the dry plate process is inferior in any way to the former method. The most celebrated photographers in the world employ Dry Plates in their work, and the results are far superior to the old method. Aside from the Dry Plate, the manner of photographing is no different from the old or wet process, the camera is practically the same, with lens, sliding tube, cap, focussing slide, etc., etc., but by means of the Dry Plate nearly all of the disagreeable and arduous labor is obviated. As soon as the proper focus, etc., is obtained (which any one can do), the prepared dry plate is allowed to receive the impression of the object, and its development and printing on sensitized paper is a matter so simple that a boy or girl of twelve years can understand and accomplish it, after reading the simple directions carefully. OUR GEM CAMERA can be taken, either indoors or out, and portraits may be taken in daylight or at night by the electric or calcium light. The great part of this camera, including lens and slides, are made for us abroad, for it would be impossible to make them in this country to be sold at the present price, and every part of the camera is made by skilled labor, the chemicals are the best, and every one is WARRANTED PERFECT. It is not necessary to enlarge upon the uses of a camera, or the desirability of possessing one. The results to be obtained from it are invaluable. There are dozens of things about every home of which a photograph is desirable,—the interior of a room, a picture of the house, or the dog, or horse, or cat, or of a baby in his crib. A moment's reflection will enlarge the list to hundreds of objects, which you would not care to take to a regular photographer, and if you do not wish to develop and print your portraits yourself, though it is very little trouble, you can take such pictures as you want, and send the exposed plates to any photographer, who will develop and print the pictures for you for a small sum. Most people will prefer to do the whole thing themselves, and will obtain the greatest pleasure and instruction from developing their own plates. (The price, as above stated, of the Camera includes all the chemicals and instructions for developing.)

AS A MATTER OF PROFIT.

We don't suppose that every one who buys a camera will want to turn it to making money, but we believe that any young man or lady can easily earn a hundred times the price of the outfit. A dozen photographs will not cost all mounted over 25 or 30 cents, and you can easily estimate what you could sell them for. The camera can be carried everywhere, and pictures of many things can be taken that would be inconvenient to obtain from a regular photographer. WHEN GOING UPON A VACATION OR VOYAGE a camera is productive of the utmost pleasure. All of the most interesting objects can be photographed and the plates kept until it is convenient to develop and print the pictures, thus preserving mementoes that otherwise would be impossible to obtain. It is only after many attempts and personal application to the manufacturers in Europe that we have been able to produce this camera at the present price, and we have no doubt but that the demand will fully justify the expense we have been in order to offer it for FIVE DOLLARS, which is the price for the camera complete, with all the articles shown and enumerated, packed in a strong wooden case with handle, and sent by express to any address, on receipt of price.

The Gem Camera and outfit complete, consists of the following articles, which are all that are necessary to take, develop, and print a photograph: BLACK WALNUT CAMERA and ACHROMATIC LENS, with sliding tube and cap, FOCUSING SLIDE and DARK SLIDE, with interior slide and flap, 1 package of instantaneous dry plates, 1 package of sensitized paper, and all the chemicals necessary for developing, printing, and toning the photographs, with complete directions, all packed in a carrying case with handle, together with a black walnut and ash tripod stand. When mounted on the tripod, the camera stands four feet and a half high.

On receipt of FIVE DOLLARS we send the camera and outfit by express to any address, or if \$1.50 is sent we will send C. O. D. for balance. Send money by Registered Letter, Money Order, Cashier's Check, or by Express. We WARRANT the camera, and for our reliability refer to any business firm in Boston. Address all orders to BOSTON CAMERA COMPANY, 35 Battery March Street, Boston, Mass., U. S. A.

and outfit consists of the articles shown in above picture. With this camera any number of photographs can be taken, either indoors or out, and portraits may be taken in daylight or at night by the electric or calcium light. The great part of this camera, including lens and slides, are made for us abroad, for it would be impossible to make them in this country to be sold at the present price, and every part of the camera is made by skilled labor, the chemicals are the best, and every one is WARRANTED PERFECT. It is not necessary to enlarge upon the uses of a camera, or the desirability of possessing one. The results to be obtained from it are invaluable. Pocket Shot Guns, 38 or 44 Calibre, same sizes and prices as above.

FIVE SUCCESSIVE SHOTS,
103 feet.

The strongest point about all the Stevens' arms is their great accuracy, the next is their lightness and portability. Mr. R. P. CORY, of Consec, Canada West, says: "I have used for three years a Stevens' 22-cal. Pocket Rifle, have shot it about 15,000 times, can kill all sorts of small game with it a great deal farther than with the best Shot Gun." Of course, the Hunters' Pets and Rifles will shoot still better. Mr. R. B. FULLER says he used a Stevens' Rifle in his gallery, 172 Clark St., Chicago, every week-day for eight years, shooting it over five hundred thousand times, and then sold it for only two dollars less than it cost him. This Target is not exceptionally fine, but gives a fair idea of what every Arm is expected to do before it can leave the factory. These Arms are sold by all Dealers, also by the General Agent, **CHARLES FOLSOM, 106 Chambers St., New York City.**

A
\$25
LANTERN
For \$12

PATENTED
Perfection
at the
LOWEST
PRICE

\$10 to \$50 easily made
EVERY NIGHT.

The World
Electro Radiant MAGIC LANTERN

The body of the Electro Radiant is a coneshaped reflector which gathers each divergent ray of light and concentrates them all on the main reflector, whence the whole mass of brilliancy illuminates and projects the picture with startling clearness. No combination of lenses, however ingenious, has ever been known to produce equal effects with the light used. The cost of an outfit to enable you to do a profitable business is small compared with the amount of money it takes to do any other business. Any one of ordinary intelligence can operate it, and \$10 to \$50 per night may be earned by giving Parlor, Sunday School, Academy or Public entertainments. For Public Entertainments, the possessor of an Electro Radiant has something that will "draw" with the combined power of the Theatre, the Circus, the Prestidigitateur, the Country Fair, the Temperance Crusade, and the Camp Meeting. A room that will hold 100 persons may be filled nightly and a good profit be cleared. You have only to tack the sheet to the wall, darken the room, place lantern on stand, light lamp, and you are ready to begin the exhibition. The Electro Radiant projects on the screen a Picture eight feet in diameter. \$10,000 were paid for the use of our Patent by Railroad Companies for Locomotive Headlights, it being considered the most wonderful light ever produced for the purpose. We have retained the exclusive right to make Magic Lanterns on the same principle, and the Electro Radiant is the result. The adjustment of Reflector, Lenses, Tubes, Slide, Rest and Cone are made with mathematical nicety. Optical laws governing such adjustments have been accurately calculated, so that you

have in our Lanterns far more than appears, and we are placing within the reach of all, unsurpassed advantages for **Learning, Amusement and Profit.** The Transparent Slides for these Lanterns embrace views illustrating wonderful natural scenes from different parts of the world. The Scriptures from both the Old and New Testaments. Temperance—Showing the folly and misery of the Drunkard. Art—Copies of famous Statues, Bas-reliefs, and Engravings. Miscellaneous—Such as Ships at Sea in a Storm, Steamboat Race, Fort Sumpter, Daylight Scene, Moonlight, etc. History—Landing of Columbus, Declaration of Independence, Yankee Doodle, etc. Comic—Slide Splitters without number. You can add to your assortment at any time. Lantern with slides complete, packed in neat box, may be easily carried in hand.—The Electro Radiant No. 2 (shown in cut with slides and fittings complete) will cost by express on receipt of \$12 00 or C. O. D. 11 50. \$3 C O is sent with order, purchaser paying the balance, \$9 00 at express office. Full instructions and list of other views sent with each order. Send money order or registered letter, send all orders to

World Man'g Co. 122 Nassau Street, New York

This Lantern can be made very profitable at Church Fairs and Sunday School Entertainments, and a large amount of cash realized at a very small outlay.

THE LADIES' FANCY WORK GUIDE TO

This book is a complete practical instructor in every description of Ladies' Fancy Work, and the only first-class work of the kind ever published at the low price of 25 cents. It contains over 200 Illustrations, and the instructions given are so plain and simple that by their aid even a child may make the many beautiful things which the book describes. It gives plain and practical instructions in Drawing, Oil Painting, and making Wax Flowers; likewise all kinds of Fancy Needle Work, Artistic Embroidery, Lace Work, Knitting, Tatting, Crochet and Net Work. It contains designs for Monograms, Initials, Cross Stitch Patterns, Knit Edgings, Embroidered Borders and Corners, Macrame Work, Applique Embroidery, Berlin Work, Java Canvas Work, Tricot and Burlaps, Antique Lace, Beaded Lace, Darned Net Work, Ties, Lambrequins, Ottomans, Counterpanes, Rugs, Carriage Robes, Brackets, Wall Pockets, Waste Paper Baskets, Work Boxes, Work Baskets, Work Bags, Pen Wipers, Hanging Baskets, Catchalls, Pin Cushions, Footstools, Handkerchief Boxes, Glove Boxes, Card Baskets, Sofa Pillows, Table Covers, Table Scarfs, Screens, Scrap Bags, Hand Bags, Table Mats, Toilet Mats, Lamp Mats, Lamp Shades, Pillow Shams, Pillow Sham Holders, Curtains, Toilet Stands, Picture Frames, Slipper Cases, Toilet Sets, Clothes Brush Holders, Cigar Boxes, Hassocks, Sachets, Fancy Purses, Slippers, Dressing Gowns, Music Portfolios, Knife Cases, Fans, Flower Baskets, Plant Stands, Flower Pot Covers, Shawls, Dress Trimmings, Window Shades, Feather Work, Spatter Work, Leaf Photographs, and many other things. It is a book that should be in every American Household. With it as a guide you may make hundreds of beautiful things for the adornment of your home and for presents to your friends at the most trifling expense, and no employment for ladies is more fascinating and useful. The book will repay its small cost many times over in a very short time. Every lady will be delighted with it. It is a large book of 64 large 3-column pages, with handsome cover, is finely printed, and contains over 200 Illustrations. It will be sent by mail post-paid upon receipt of only **Twenty-five Cents** in postage stamps, or five copies for \$1.00. HARROW

The Best Periodicals for Country Homes.

HARPER'S MAGAZINE.

The circulation of HARPER'S MAGAZINE has always been greater than that of any other periodical of its class in America; while in England it has outrun all the English magazines of its price.

Its serial and short stories, its poems, essays, and richly illustrated articles, cover every subject of interest in travel, biography, history, literature, art, and industry.

Notable novels are first printed in its pages as serial stories. The most brilliant writers of America and Europe, in every department of letters, are its contributors, while its illustrations are the best work of the most skillful artists and wood-engravers of our time.

The editorial departments are abreast of the age in every human interest. The "Easy Chair" chats wisely and wittily of subjects on which everybody is thinking; the "Historical Record" gives a comprehensive summary of the world's progress; the "Literary Record" presents a critical review of current literature; and the "Drawer" with its exhaustless supply of good stories, is a source of perpetual amusement.

A like variety of equally good literary and art work cannot be bought in the form of books for many times the price of the Magazine.

Subscription Price, \$4 per Year.

HARPER'S WEEKLY.

HARPER'S WEEKLY is the best illustrated paper in America. It presents, week by week, in faithful and graphic pictures, the noteworthy events of the day; portraits of men of the time; reproductions of the works of celebrated native and foreign artists; cartoons by eminent pictorial satirists; and humorous illustrations of the ludicrous aspects of social and political life.

HARPER'S WEEKLY always contains instalments of one of the very best novels of the day, with fine illustrations. Its short stories are bright and entertaining. Poems, sketches, and papers on important topics of the day, by the most popular writers, and columns of humorous and personal paragraphs, make it interesting to everybody.

Its pages are kept free from everything which would unfit it for the family circle. In art and general literature it always appeals to, and cultivates good taste. In the field of politics it holds country above party; and while it upholds the grand fundamental principles of the Republican Party, it maintains its right to criticize and dissent.

Whoever wants a Cosmopolitan Independent, Illustrated Newspaper, should subscribe for HARPER'S WEEKLY.

Subscription Price, \$4 per Year.

HARPER'S BAZAR.

HARPER'S BAZAR, published weekly, is the woman's paper. Its Pattern Sheet Supplements alone, of which between twenty and thirty are issued each year, will enable any lady of moderate means to dress tastefully and fashionably, and to save much more than the price of subscription, by furnishing her with the latest patterns of ladies' and children's dresses, wraps, etc. Each Supplement contains a dozen, or more, patterns for which no extra charge is made.

All subjects that pertain to the realm of domestic economy are treated from time to time in the columns of HARPER'S BAZAR; Cookery for the well and sick; the management of servants; the best methods of regulating the necessary expenses of the family; social etiquette and usages; gardening, etc. Ladies will find in it practical instructions which will aid them materially in remodelling their dresses, refurnishing their houses tastefully and cheaply, and in economizing in various other directions.

Its stories, sketches, and other articles being furnished by the best writers of America and Europe, while its superb wood engravings are marvels of perfect execution.

Subscription Price, \$4 per Year.

HARPER'S YOUNG PEOPLE.

HARPER'S YOUNG PEOPLE, published weekly, is the best help to the parent and teacher, exerting a refining influence through its entertaining stories, anecdotes of travel, biographical sketches, scientific articles, etc. The engravings and typography are unsurpassed in merit, attractiveness, and artistic finish.

A leading journal says: "The villainous trash, the penny dreadful boys' and girls' papers," at one time so popular and so numerous, have nearly all, thank fortune, been driven from the field by the introduction of publications for the young which are just as cheap, and perfectly healthful and wholesome. This good work of reform was led by the Harpers of New York, with their handsome YOUNG PEOPLE."

Boys will find in its pages entertaining descriptions of different athletic sports and popular cut-door amusements; and girls will be interested in the directions for making dolls, dolls' clothing, embroidery, crocheting, etc. A valuable feature of the periodical is the Post Office Box, which affords to the young readers an opportunity to correspond with the Postmistress and with each other, thus giving them ease and familiarity in the use of language. Specimen copy sent on receipt of 3 cents.

Subscription Price, \$2 per Year.

NOTICES OF THE PRESS.

The superb periodicals published by Harper and Brothers, in one way or another, in politics, events, fashions, inventions, trades, new and standard interests in the arts, sciences, travel, discovery, criticism, instruction, illustration, amusement, offer a complete epitome of the year. — *Philadelphia Ledger*. — One or the other of these Journals should find its way into every family. — *Southern Planter*, Richmond, Va. — There can be no more acceptable Holiday gift, than a subscription for HARPER'S MAGAZINE, HARPER'S WEEKLY, HARPER'S BAZAR, or HARPER'S YOUNG PEOPLE, or better still, for the entire four publications. — *Philadelphia News*. — These publications are among the best of the kind in the country, or in the world. — *Springfield Republican*. — HARPER'S MAGAZINE, HARPER'S WEEKLY, HARPER'S BAZAR, and HARPER'S YOUNG PEOPLE, are welcome and familiar visitors in thousands of households all over the country. A year's subscription to one of them would make a decidedly welcome Christmas present for adults or children. — *Baltimore American*. — Each of these publications in its own field has become as familiar as a household word, and is regarded almost as a household necessity. — *Boston Journal*.

Subscriptions will be commenced with the Number of each Periodical current at the time of receipt of order, except in cases where the subscriber otherwise directs. Remittances should be made by Post-Office Money Order or Draft, to avoid risk of loss.

November.

"The mellow year is hasting to its close;
The little birds have almost sung their last,
Their small notes twitter in the dreary blast—
That shrill-piped harbinger of early snows."
HARTLEY COLERIDGE.

Friends, Greeting!

One and All!!!

The American Agriculturist Family Cyclopædia presented to every Subscriber of the *American Agriculturist*—new or old, whose subscription for 1885 is forwarded together with \$1.50, and 15 cents extra for postage, before December 1st, is giving the greatest satisfaction. The features of the book are fully described on page 452, of the October Supplement (Premium List). When the Cyclopædias are delivered here at the office, the Subscribers save the 15 cents for packing and postage. We take great pleasure in presenting this Cyclopædia to every Subscriber, not because the *American Agriculturist* is not richly worth five times the subscription price, but because it is a valuable acquisition to any home, and may persuade very many not now subscribers, to become such. Furthermore, old Subscribers will not feel inclined to complain that they are not remembered by us in common with the new subscribers.

Every Subscriber to this Journal, every Club Raiser, every Canvasser, and every Exchange Newspaper, will please immediately turn to page 518, for information of interest and value to one and all.

A Wonderful Journal.

Hon. Henry Smith, of Albany, Ex-speaker of the New York Legislature, one of the foremost lawyers of this State, and an old subscriber of the *American Agriculturist*, writes us from his farm, under date of September 28th: "Your October number is a miracle; how you can furnish such a publication at that price is wonderful. I should think that every one who can read, would take it." We propose that each succeeding number shall surpass the previous.

Birthday and Holiday Gifts.

The magnificent Premium List which accompanied the October number, affords an opportunity for all of our readers, old and young, to procure presents for their friends without money and with but little labor. You can now secure and forward us the necessary number of subscribers to entitle you to any premiums which you may desire for yourself or to use as presents for the coming holidays.

Arrival of the New Owner.

After remaining in the family for three generations or more, the old Homestead has finally passed into the hands of a new owner. A young city man, yielding to the growing taste for country life, has purchased the broad acres, made his first appearance, and is now telling the hired men what he wishes to be done over there. See preceding page.

There is nothing to be gained and much to be lost by getting behindhand with farm work. This is true of all seasons of the year, but it is specially true in the autumn. The days are getting shorter and shorter, and the weather more uncertain. Hire a little extra help, if need be, get started early in the morning, and make a short nooning. It grows dark early in the evening. Corn stubble intended for oats or barley in the spring, can often be plowed to better advantage in the fall than in the spring. If it is good, strong land that you wish to plow an inch deeper than hitherto, the fall is the better time to do the work. The new, raw soil will be mellowed by the frosts of winter, and will crumble to pieces in the spring. You should put three horses to the plow and make thorough work. If you have not time to plow, or the soil is so light that you prefer to let it remain unplowed until spring, it is a good plan to harrow down the cornstalk stubs and make the field ready to plow the first thing in spring, and so with the potato ground, get the stems out of the way this fall, either by drawing them home, burning them, or spreading them on the land. An hour's work now will often save two hours or more in the spring.

Live Stock Notes.

There will soon be a daily out-go of fodder, and the problem of winter feeding, and care of live stock, is to so govern this expenditure, that the best returns may be obtained. All the farm animals should be in good flesh and health upon the opening of winter. If these conditions are continued, the stock are well kept, and will not come out "spring poor" at the end of the winter. Manure is not to be overlooked in the winter system of farm management. Farmers, more than ever before, must feed for manure, and husband it when obtained. An abundance of wholesome food, plenty of pure water, warm, dry quarters, and sufficient fresh air, are four of the leading essentials in wintering farm stock. It does not follow from this, that the animals must be kept in the stable, or under the shed at all times. Frequent exercise in the open yard is profitable when the weather is suitable. Keep the work horses busy in the field preparing for the coming spring, and feed them well with a variety of food. A few chopped apples serve as an appetizer. Colts need to be pushed in their growth with rich food and good care. Cows taken up from grass, need a mixture of hay, corn-fodder, and meal—all they will eat up clean, or else the flow of milk will greatly decrease. One-third of a cow's allowance is not too much for a calf. Sheep may be the last stock to go into winter quarters. Keep only thrifty sheep through until spring. Fattening pigs should now be growing rapidly. Grain is low and meat is high, therefore convert the former into the latter. There are many things that will add to the comfort and convenience of caring for live stock in winter. Provide ample feeding room for all animals. Place the feed racks, etc., where most convenient.

Orchard and Fruit Garden.

Trees and fruit-bearing shrubs may still be planted, provided the weather remains mild. If the conditions are unfavorable, heel-in the trees, being careful to cover the roots well with soil, for spring planting.... Young trees, planted this fall and last spring, should have a steep mound of earth, about a foot high at their base, to enable them to resist the winds and to keep off mice.... Rabbits are repelled by rubbing the trunks with bloody meat or sprinkling with blood. They are at their best this month, and a stew or pie of fat, young rabbits, is a luxury to be procured by paying the boys a premium on those they trap.... Make a record of all trees planted now or recently; noting the number of the row and the place of each tree in the row is much more reliable than any label.... Look to gates and fences, and make all secure.... Keep fruit as cool as possible without freezing; open the cellar or fruit house when the weather allows.... The best cider is made in cool weather, when fermentation can go on slowly. If for vinegar, it may be made at any time.... Prune grapes, currants, and gooseberries soon after the leaves fall. If more plants are needed, make cuttings; they may be planted at once, covering them with straw or litter, or tied in bundles, labelled, and buried in a dry place.... Cions may be cut and packed in saw-dust in the cellar.... Strawberry beds should be covered when the surface freezes, using straw, swale hay, leaves, or cornstalks, covering the plants but slightly, and the soil between them more heavily. Leaves may be kept in place by laying on light brush, or sprinkling soil upon them.

Kitchen Garden.

Beets and carrots should not be exposed to hard frosts; parsnips and salsify are better for freezing and thawing. Roots of all kinds may be stored in trenches or in small quantities in boxes or barrels in the cellar, covering them with earth.... Celery is to be stored in trenches a foot wide, and deep enough to receive the plants, or in a cool cellar in long boxes, nine inches wide and as deep as the plants are tall, placing earth on the bottom of the boxes.... Cabbages are set on the ground, roots up, and covered with earth. For a supply of parsley in winter, take up the roots, plant them in a box of soil which is to be set in the kitchen window.... Plants of cabbage, cauliflower, and lettuce for early spring planting, should be pricked out into cold frames. Do not cover the frames with their sashes until freezing weather.

Flower Garden and Lawn.

All improvements, such as new borders, walks, and drives, can be better done now than in spring.... Leave a good length of grass on the lawn to protect the roots. Top dress with good compost

or ashes; nitrate of soda, and other commercial fertilizers, are best applied in spring.... Plant ornamental trees and shrubs if the weather is mild. Collect leaves from the lawn and road-side, and store under cover or in heaps with boards laid over them.... Plant hardy bulbs if any are left out.... Hardy young trees are helped by protection the first winter; evergreen boughs placed around them are better than bundling with straw.... Have snow-plows ready for cleaning walks and drives.... Half

or touch with a small brush dipped in alcohol.... In watering, wait until the plants show that they need it, then give it copiously. Hanging-baskets are best watered by plunging them into a pail of water.

Where to Look for Improvement.

In wheat, barley, oats, Indian corn, buckwheat, peas, beans, potatoes, apples, pears, peaches, apricots, plums, nectarines, quinces, currants, gooseberries, raspberries, strawberries, melons, squashes and cucumbers, we must look to new varieties for improvement. But in the case of cabbage, cauliflower, beets, celery, turnips, carrots, parsnips, onions, salsify, etc., we should look to careful and judicious selection rather than to new varieties. Take turnips as an illustration. The turnip naturally runs to seed the first year. But we now grow it, not for the seed, but for its root. We have converted the plant from an annual to a biennial. We sow the seed in the spring or summer, raise a crop of turnips with the desired large, nutritious, well-formed roots. We select the best of these roots and set them out the following spring, and in June or July get a crop of seed. The care with which we select these roots to be set out for seed, determines largely the value of the subsequent crop. If, instead of sowing seed from carefully selected and transplanted roots, we should sow turnips very early in the spring, and let such as might do so go to seed, and if we gathered this seed, and sowed it again early next spring, we would have a far greater number of plants that would run to seed, and even those which did not actually produce seed, would have a tendency in this direction. They would have long necks, and miserably poor, small roots. And if we set out these long-necked turnips for seed, we should probably get a big crop of turnip seed, but from such seed, what kind of turnips should we be likely to get? The same remarks will apply to cabbage, beets, carrots, parsnips, etc. We do not object to new varieties. In fact, we give them a hearty welcome. But a new and really valuable variety might be ruined in a very few years, if proper care is not exercised in selecting the plants. With

ANTHONY BENEZET ALLEN,
FOUNDER AND FIRST EDITOR OF THE AMERICAN AGRICULTURIST.

The engraving of Mr. Allen, which our artists have just executed for this Journal, will be recognized as wonderfully natural and life-like by his friends and admirers. An exceedingly entertaining account of his visit to Mr. Allen during the last week of last September, is given on page 509 by Dr. George Thurber, who for nearly a quarter of a century has held the position of Editor-in-Chief of the *American Agriculturist*. The labors of these two gentlemen in promoting and developing agriculture, are coming to be recognized in every farmer's home, notwithstanding that the modesty, which always accompanies true worth and merit, has caused them to shrink from publicity. -- PUBLISHERS OF THE AMERICAN AGRICULTURIST.

hardy and tender plants should be taken to the cellar before they are injured by freezing.

Greenhouse and Window Plants.

Plants that have been out of doors through the summer, need a gradual change to confined air and heated rooms.... Begin the fight with insects on their first appearance. Green-fly, red-spider, and mealy-bug, are most common. Use tobacco smoke or tobacco water for the first, a frequent showering of the leaves on the under side for the red-spider, and for mealy-bugs, pick off with a pointed stick,

potatoes the ease is different. We do not raise potatoes from seed. We grow them as we do apples from the bud. If we want a better apple, we get a better variety. If we want a better potato, we must get a better variety. If we want better cabbage, beets, turnips, carrots, onions, etc., our surest way of getting them is to be careful in the selection of those we set out for seed. Our cultivated plants, especially those valued for their roots, are in an unnatural condition. Their size has been increased by high cultivation and careful selection of the best specimens for bearing the seed.

Cross-bred Horses.

The improvement in American horses within a few years has been very marked. Heavy draft-horses were rare in New York twenty years ago. One saw in our city streets few horses weighing over twelve hundred pounds. Our vehicles were adapted to light horses, and expressmen and truckmen had to carry light loads and go the oftener. It is not to be wondered at that foreigners, especially English, Scotch, Dutch, and French, sadly missed the grand draft-horses of their own countries. Finally our horse-breeders waked up to a sense of the situation. A few French horses and Clydes were imported, and it was found that even with mares of moderate size, as a rule, excellent results were obtained, many of the cross-bred horses exhibiting an apparent improvement upon their sires, having great substance and muscular power combined with a grace of action and style not possessed by their more ponderous progenitors. There is a great deal of good blood in American horses, and in a violent cross like that with the Percheron or the Clyde, the blood in the mare often asserts itself in refining the points of the draft-horse, reducing the heavy limbs and clumsy fetlocks of the Clydesdale, lightening the neck and bringing up the sloping rump of the Percheron.

Our eastern cities have, so to speak, consumed an immense number of horses of this general character, chiefly geldings of course, for the half-bred mares have been kept upon the farm, and now-a-days, being bred back to the same style of horse as their own sires, are giving us a noble class of useful horses, which are becoming a striking feature of New York and Boston, at least, and no doubt in a less degree of other American cities. The express business has increased, as we all know, to enormous proportions; the companies are rich and use many horses. It is indispensable to them to have good horses, and the pride of proprietors and employees is to have handsome ones, which, with their neat wagons and excellent harness—as showy as strict adaptation to business will allow, make very handsome and imposing “turn-outs.” They require horses for quick draft, active, above medium weight, good walkers, and capable of trotting off now and then at a rattling pace. They do not want all large horses, and

it is quite important that though heavy they should trot easily. It is not strange then that among the fine express horses we see many having half or two-thirds Percheron blood. They have many of the points of the full-bloods—not infrequently are of a dappled-gray color, short coupled, with sloping shoulders, straight backs, neat, well-shaped heads, great breadth of chest, loin, and

and weighing about twelve hundred pounds. The picture of the horse standing still represents a fine, half-bred Clyde gelding, contrasting strongly with the Percheron half-blood in length of body, but otherwise showing less distinctly the prevailing differences of style. The shoulders are straighter, the legs flatter and more hairy, and the head more or less delicate in proportion. Such horses are adapted

usually to slower motion, heavier draft, yet active, and capable of taking a trot if pushed. They average a good deal heavier than the true Percheron half-breeds, and even than those of the Norman cross, which, as is well known, is a heavier and coarser French breed, which has been largely imported on account of the difficulty of obtaining the full-blooded Percherons. There is, among the grades, much difference in weight, and the style is greatly modified by the dam, so that not a few of the Clyde cross are stylish enough for coach horses, and resemble not a little that fine English breed, the Cleveland Bays, while others are heavy, and slow-moving, ponderous, and powerful—

qualities which fit them for the heaviest draft purposes. Hence these find employment in moving safes, heavy timber, granite blocks, and other massive building stones, iron beams, pillars, trusses, and the like. In color, these Clyde horses are of a bright bay or brown, often dappled, frequently having one or more white feet, and in many respects remind one strongly of their sires. They are great favorites, have usually excellent

feet and legs, which are clean and free from puffs or bony enlargements, but generally hairy about the fetlocks. The shoulder is more upright, and better adapted to a dead pull and heavy draft.

It really matters little which of these two excellent breeds is selected by farmers to breed their large, well-formed mares to. They must, however, be sure that the horse is pure-bred—either imported, or with a verified pedigree. The mere fact of importation is no proof that the horse is really good, but it is very strong presumptive evidence that he is pure, for few men would be so foolish as to be at the trouble and expense of importing a low-bred horse for

breeding purposes. It is just as poor policy for any stock raiser to breed from half-bred horses, as it is from half-bred bulls, though the bad results are more immediately obvious in the case of neat cattle. Another point—if after a few years you have

Drawn (by Forbes) and Engraved for the American Agriculturist.

rump; fine, flat legs, clean and free from hair, and feet hard, round, and sound as any one could desire. They are willing and powerful pullers, rarely, if by true Percheron sires, showing any defect like spavin or ring-bone. With a natural tendency to trot on the sire's side, and this in no way decreased by the qualities inherited from their dams, it is not to be wondered at that those horses, though weighing sometimes as much as fifteen to

Fig. 2.—A HALF-BRED CLYDESDALE HORSE.

Drawn (by Forbes) and Engraved for the American Agriculturist.

sixteen hundred pounds, should be capable of taking an easy if not a rapid trot, even with a load. We present an engraving of a fine horse, showing off this valuable quality, not a fancy sketch, but a portrait of one of the type of which we write,

some fine half-breed mares, kept to take the places of their dams as workers and breeders on the farm, breed them either to horses of the same breed as their sires, or to thoroughbreds, or to fine, long-pedigreed trotting stock. The market is our safest guide in breeding. Fashions change slowly, and a really first-class article is always salable.

The cross made by breeding half or three-quarter breed "Percheron-Norman" mares to Clyde horses results very favorably. Some of the best heavy draft horses in this city have thus the combined blood of these two grand breeds. In them the sound, well-shaped, hard feet of the Percheron carry the heavy bodies of the muscular, broad-chested Clyde, with their large-jointed flat legs, while they take after their dams in being short coupled, with moderately sloping shoulders and fine action.

The raising of these draft horses, if by good sires, is profitable, those weighing fourteen hundred to sixteen hundred pounds bring three hundred dollars in the market at five years old. The demand is so great now that we suppose it would be quite impossible for a dealer to pick up a car load from first hands in any part of the country within a radius of fifty miles. The reason for this is that yearlings, and two and three-year-olds, are largely bought up from the western breeders, and sold to go still further west among the pioneers, who raise them and use them for breeding purposes.

The farmer who undertakes to supply this insatiable market, must be on his guard. There have been hundreds of veritable brutes imported. Pure-blooded they may be, but they are not good. The supply of first-class horses of either French, Scotch, or English "shire" blood is limited, and the demand here is so great that the importers in many cases have brought out anything that would sell. So we have stallions standing all over the country who only, as it were by accident, ever get a decent foal. Still, even these "great, ungainly, gaunt, and awkward" half-bloods, bring a pretty good price. Their sale cannot, however, be depended upon, and the only safe policy is to breed from first-class sires.

RATS IN POULTRY HOUSES.—HEAD THEM OFF.—

The loss by rats is much greater than most poultry keepers are aware; they steal eggs and chicks, and rob the fowls of their food. It may be prevented, in part, by a well-trained ferret or two, and a couple of good rat-catching dogs will soon clean out the rats, if these, their natural enemies, are properly used. As these are not always available, the next best thing is poisoning the rats. In using poison, it must be remembered that it is no respecter of persons, and will be as deadly with children, with poultry, dogs, cats and other animals, as it will with the rats. The utmost care must be exercised in its use, and the only time it should be set where the rats can get at it, is at evening, placing it where nothing else can reach it. Early next morning, remove all the poisoned bits of bread or meat to a secure place, and replace them next evening. Two or three "treats" of this kind, two or three times yearly, will completely rid the premises of rats. The phosphorous poisons are generally to be preferred, as they are more enticing to the rats than any other kind we know of. It does not pay to tolerate these sources of annoyance and destruction. Poison the rats.

Angus Cattle.

The Angus, or as it is called, the "Aberdeen-Angus" breed, is one of the most useful and attractive breeds of beef cattle. It originated in the eastern part of Scotland, in what are termed the Lowlands, among the wide-awake breeders of beef cattle for the English markets. Prominent among whom it is pleasant to notice the name of Hugh Watson, often recurring in the pedigrees of some of the best families. He was the father of the late William Watson of New York, and Westchester County, famous as an importer and breeder of Ayrshire cattle, whose sons still show the family trait of fondness for live stock, and success as breeders. The breed has not been long fixed, yet polled cattle have been numerous in this part of Scotland for nearly two hundred years, and probably longer. It was not until the interest in breeding and improving neat cattle became general among intelligent landholders and breeders, that this breed began to be developed as a distinct and valuable class of cattle. This chiefly occurred

accomplishment with the latter class of men, and which would be almost invaluable to them in improving their herds. The essential characteristics of the breed are: First, a lack of horns, or even buttons, nubbins, or scurs, by which names the little misshapen bits of horny substance are called, which occasionally occur even in pure herds. They are of frequent occurrence among grades, which indeed often have small horns. The buttons or scurs have no bony attachment, but hang by the skin alone, and no doubt indicate a not very remote horned ancestor. Second, a black color with little or no white, the less the better. The occurrence of other color than black-brindle, red, etc., is regarded as a disqualification in a breeding animal, and yet a slight shade of brown is sometimes admissible we believe. That is, the black is not necessarily, though always preferably a true black, but it may shade to brown. Third, a symmetry, which in Angus cattle, and in fact in all the polled breeds is essentially different from that of the Shorthorn, which is generally taken as the highest type of a beef animal. It, however, more nearly

approaches that of the Hereford and Devon, which occupy a scarcely lower position to the Shorthorn as typical beef breeds. Angus cattle are long, level, low set, on fine limbs with small bones and fine heads and tails. They have, however, more roundness of outline, are not so square, and well blocked out as the Shorthorn, neither is there the same tendency to the deposition of fat in lumps upon the rump and sides. They are of large size, or rather of great weight, and in this respect disappointing, for they are generally much heavier than they look; are good handlers, have soft, furry unctuous coats, are quick feeders, and come early to maturity, thus forming a breed possessed of really superlative char-

acteristics in many respects, which can hardly be too highly recommended. The grades are generally hornless, and in other respects take after their polled sires. They may be closer packed in railway cars for transportation, and from their quietness and inability to injure or worry one another with horns, they are moved with less danger and much less shrinkage. We present, as an illustration to this article, the portrait of the excellent four-year-old Angus cow "Eye-bright 4th," owned by the Kansas State Agricultural College. She was bred by the Ontario Experimental Farm, her dam, "Eye-bright 2nd," was imported, as was also her sire, "Gladiolus" (1161), bred by the Earl of Fife.

THE ANGUS COW "EYE-BRIGHT 4TH."

Drawn (by Sprague) and Engraved for the American Agriculturist.

after the year 1825, and since about that time to the present, the Angus breed of cattle has gone steadily on gaining as well in merit as in public favor.

Ever since the multiplication of those wretched brutes of more or less Spanish blood, the Texas cattle, whose long horns and intractable dispositions make them dangerous as well to one another as to their herdsmen, Agricultural writers—among them Mr. A. B. Allen, and Col. Weld, have urged the use of Scottish polled bulls, so that the cattle of the Plains might gradually be disarmed and rendered more docile and more useful. "Line upon line," and "precept upon precept" were not uttered in vain; finally Mr. George Grant imported some fine Angus bulls in 1873, which we had the pleasure of seeing in New York. They were taken with a lot of Shorthorns to his "colony," at Victoria, Kansas, and gave the first practical demonstration of the great value of Angus grades—the cows as breeders and the steers for beef. Since then there have been a great many importations. There is an Angus herd book started, but the first volume is not yet issued, and the breed is daily growing in popularity. It should be borne in mind that this is preëminently a beef breed, and that as such all the valuable beef points have been, and are cultivated, forming the criterions of excellence. Every butcher and drover knows what there are, and every breeder ought to know as well—but they do not. The breeders are no doubt more familiar with well-shaped animals, and with good handlers and quick-feeders too, than the butchers and drovers are, and yet they lack, as a rule, that quick discernment which is a professional

FOWLS FOR WINTER LAYING.—Eggs bring a much higher price in winter than in summer, and all who keep poultry would like to have winter layers; yet many of us think we can get them without paying the price. We do not mean the first cost, but the care and continued good management which they must have to enable them to lay plenty of eggs when these are scarce in the markets. For winter egg-production, there is nothing better, as a start, than extra early hatched pullets, not much matter what the breed, so the surroundings and conditions are what they should be. Some breeders make good winter layers out of the White Leghorns, while others fail to do so, on account of their having such large combs, which are readily frosted. We select birds with very moderate or small combs, to prevent the possibility of injury from a sudden and severe change in the weather.

Walks and Talks on the Farm.

New Series.—No. 5.

JOSEPH HARRIS, M. S.

An English gentleman who came over in the "Oregon" in less than six and a half days, was looking at my Northern Spy apples. "If you would put them in small pails" he said, "and send them to Liverpool, I could sell them for you at a good price. People do not want to buy a whole barrel at a time. But they would gladly buy a pailful. Your barrels are worth little or nothing after the fruit is out, but the pails would be worth with us more than they cost you here. I saw a pail to-day used for shipping tobacco that is just the thing."

"I am afraid it would not work," said the Deacon. "The apples would have to be pressed, just as we now press them in the barrels, and in such small packages the proportion of apples injured in pressing would be much greater than in barrels of the present size. And besides they tell us that our Western New York apples will not sell in England because we use barrels that do not hold quite as many quarts as flour barrels."

"They must be great duffers" said the Englishman. "Our apple crop is a failure this year, and your apples will be wanted. We have had the grandest crop of strawberries this year I ever knew, and they sold as low as a penny a quart. We have not learned how to get them to market in as convenient packages as you use. Your agricultural papers have done great things for American farmers and fruit-growers in many ways, not least in recommending more attention to the methods of marketing."

"That is true," said I, "and while at first thought, I was inclined to agree with the Deacon, that we could not use small pails for shipping apples, I am not sure that the plan will not work. We could avoid the crushing the Deacon speaks of by using a false-head for pressing down the apples. This false-head could be covered on the inside with some soft, elastic material that would not bruise the apples in pressing. We could fill the pail, as we now fill the barrel. Put on this false-head with the soft lining, press the apples down firm, and then take off the pressure, remove the false-head, and put on the regular wooden head and nail it down or use a hinge strap to hold it in place."

"But," said the Deacon, "could they be sent on the cars and steamers?"—"Why not," said the Englishman, "you send your land over in pails, and I do not see why you cannot send apples. And, as I said before, people would buy them because they are easily handled, and because the pails would be useful after the fruit was removed."

"Do you use our American beef?" asked the Deacon, "and how does it compare with the English?"—"It is the best beef in the world," said my English friend, "but I do not buy it. If I should order American beef my servants would not touch it. I have no doubt our butcher sends it to us occasionally, but he claims to sell only English beef."—"That proves two things," said the Doctor, "first, that prejudice is strong, and second, that the beef, after its long journey, is sometimes strong also. How best to get our cattle and sheep to Europe is still an open question. I am not sure that the better way will not be to send our store steers and store sheep, and let them be fattened in England. Cattle have been carried by steamer from Boston to Liverpool for five dollars each."—"The English market," said I, "is worthy of some consideration, but our own markets are of ten thousand times more consequence to American farmers. Nineteenths of the beef eaten at my table comes from the West. Our butchers buy the cattle in Buffalo, and I am not sure, quality considered, that I do not pay more for beef, here on the farm, than it is sold for in Liverpool. Our meat has greatly improved during the last twenty years, but much of it is still far from what it should be. Poor meat is a costly article."—"Yes," said my English friend, "judging by the prices you pay for things over here, I conclude you must all be millionaires."

"Wheat," said the Deacon, "is only worth eighty-five cents a bushel to-day, and the millers are not anxious to buy."—"They won't get my wheat at that price," said the Squire. "One thing is certain, wages must come down or wheat go up."

"There were several hundred steerage passengers," said my English friend, "on the 'Oregon,' who paid only fifteen dollars each and found. They went to church at Queenstown on Sunday morning, and the next Saturday night were in New York, and it would seem in such circumstances that, as the Squire says, wages must come down nearer the English level. But such will not be the case as long as everything is so dear here."

My English friend said not a word about free-trade, but it was easy to see what he was driving at. "The argument," said I, "may apply to married men with families, but take a young man who can get two hundred dollars a year, including board, washing and mending, how do our high prices for some things affect him? If he smokes cigars, and attends every pic nic and dance in the neighborhood, and drives a horse and buggy, and wears shoddy clothes and bogus jewelry, he might as well be on the other side of the water. But if he will act like a man, he can save money enough in a few years to buy a small farm. And in spite of what the Squire says, this country needs more such men, and is prepared to give them a cordial welcome. Mark my word, wages are not going to be much lower here, and notwithstanding the low price of wheat this year, farmers are not all going to the poor-house. Life goes on. Work will not cease. People will eat and drink and wear clothes and travel and read; they will need doctors and lawyers and parsons and school-teachers as much now as ever. Let us be more hopeful, and stick to the work that our hands find to do. Happy is the man who knows his work and does it."

"What we want," said the Doctor, "is not lower wages, but more intelligent workmen. The best men are the cheapest. Our wheat-growers need not be afraid of competition with the cheap labor of India. The right kind of agriculture is going to be more profitable than it has ever been. It will require more capital and more brains, and I am happy to believe that capital is yearly becoming cheaper and brains more abundant."—"They are both pretty scarce in these diggings," said the Deacon, "and those who have interest to pay, find it no easy matter to get the money."—"That is true," said I, "interest is a great tyrant."

"Potatoes ought to be a profitable crop with you," said my English friend. "A farmer told me yesterday, in Rochester, that he got fifty cents a bushel for them."—"Yes," I said, "I heard him tell you so, and I presume he told the truth. But he always gets about ten cents a bushel above the market price. He has fine, sandy land, and takes great pains with the crop, and has a regular set of customers, who pay him an extra price, because they know he always has the best potatoes. He has grown rich at the business."—"If it pays to use superphosphate on wheat at eighty cents a bushel," said my English visitor, "it ought to pay you to use it on potatoes at fifty cents. It is quite as easy with us to grow four hundred bushels of potatoes per acre, as forty bushels of wheat."—"Perhaps so," I said, "but when I was in England, in 1879, the heaviest crop of potatoes on the experimental plots at Rothamsted, was only one hundred and thirty-nine bushels per acre, and on the unmanured plot only thirty and one-third bushels per acre, and of these only twenty-one bushels were 'good.' Nine bushels were 'small'."—"I suppose the crop was injured by drouth," said the Deacon.—"It certainly was not drouth," I said, "it was more likely to be drowning. The real cause, however, in my judgment, was a lack of sunshine. The land was clean, and the potatoes looked healthy, but there was no vigorous growth such as we see here in our bright American sunshine. On plots dressed with nitrate of soda and ammonia salts, the vines were of a very dark green color."—"Too much nitrogen," said Dr. Gilbert. Doubtless that is the proper view to take of it, but I should have said 'too little phosphate and too little sun.'"

Taking the first five years of the experiments, 1876-1880, the average yield from the plot without manure of any kind, was (calling fifty-six pounds a bushel) ninety-three bushels per acre. With three hundred and ninety-two pounds of superphosphate, the average yield was one hundred and forty-seven bushels per acre. With three hundred and ninety-two pounds of superphosphate, and an ample supply of potash, soda, and magnesia in addition, the average yield was a little less than one hundred and fifty-two bushels per acre. With fourteen tons of barnyard manure per acre, the yield was one hundred and eighty-seven bushels per acre. With fourteen tons of barnyard manure, and three hundred and ninety-two pounds of superphosphate, the yield was two hundred and twelve and one-half bushels per acre. With fourteen tons of barnyard manure and three hundred and ninety-two pounds of superphosphate, and five hundred and fifty pounds of nitrate of soda, the yield was two hundred and sixty-nine bushels per acre. With five hundred and fifty pounds of nitrate of soda, three hundred and ninety-two pounds of superphosphate, an ample supply of potash, soda, and magnesia, but no barn-yard manure, the yield was two hundred and ninety-three bushels per acre.

"It would seem from this," said the Doctor, "that we could use superphosphate on potatoes with considerable profit. When used alone, it gave an average increase of fifty-four bushels per acre. When used with barnyard manure it gave an average increase of twenty-five and a half bushels per acre. What we should like to know is, how much increase it produced when used with nitrate of soda; but the experiment was not made."—"I can't understand what you are talking about," said the Deacon, "place the figures side by side."—"The Deacon is right," said I, "and while the Doctor makes the table, let me say that these experiments on potatoes at Rothamsted were commenced in 1876. Potatoes have been planted on the same land every year since, and the same manures are used every year unless otherwise stated. The field looked to me as not specially well suited to potatoes. It was good, strong, loamy land, full of flint-stones. Here we should prefer lighter land if we had it, and if not, we should want to plow under some clover or manure to lighten up the soil. The land was kept scrupulously clean, and the plots beautifully laid out. There is an idea in this section that we shall ruin our land by using superphosphate. It is thought the land will get 'hard' and that we must plow under clover or rye or straw or buckwheat or manure to lighten it. So far as mechanical condition is concerned, these experiments at Rothamsted do not seem to confirm this idea. If the potatoes have food enough, they can dispense with the mechanical effect of the barnyard manure."—"I am glad to hear you say that," said the Doctor, "for I heard you say the other day that you believed you had made a mistake in not growing more clover, and you are growing rye to plow under to lighten the land."—"Never mind that," said I, "we are talking about the results at Rothamsted, where there is no guess-work."—"The first year of the experiments," said the Doctor, "the yield was as follows:

	BUSH.
No manure.....	154
Superphosphate alone.....	242
Superphosphate and potash, etc.....	247
And nitrate of soda.....	342
Nitrate of soda alone.....	154

The average yield per acre of the first five years, was as follows:

	BUSH.
No manure.....	93
Nitrate of soda alone.....	128
Superphosphate alone.....	147
Superphosphate and potash, etc.....	152
And nitrate of soda.....	293
Superphosphate and nitrate.....	Not tried.

The next year, 1881, or the sixth crop in succession on the same land, the yield was as follows:

	BUSH.
No manure.....	81½
Nitrate of soda alone.....	127½
Superphosphate alone.....	225
Superphosphate and potash, etc.....	237
And nitrate of soda.....	400
Fourteen tons of barnyard manure.....	320

In 1882, the seventh crop in succession, the potato yield on the experimental plots was as follows:

No manure.....	78
Nitrate of soda alone.....	83½
Superphosphate alone.....	191½
Superphosphate, potash, etc.....	180
And nitrate of soda.....	289½

Last year, 1883, the results were as follows:

No manure.....	104
Nitrate of soda alone.....	125
Superphosphate alone.....	199
Superphosphate, potash, etc.....	198
And nitrate of soda.....	325½

"From the results," said the Doctor, "it is quite clear that we can use superphosphate on potatoes with considerable profit."—"There can be no doubt about it," I said, "especially if the land is in good condition; for instance, if it is a good clover or grass sod, which, on decomposition, furnishes the nitrates, potash, etc. The superphosphate alone would have a greater effect than in the above experiment, where the potatoes are planted year after year on the same land."—"Your method," said the Deacon, "of applying superphosphate to potatoes, is a good one, and ought to be generally known to American farmers."

The method which the Deacon alludes to is a very simple one, and is practised, I presume, by many others. We mark out the land in rows thirty-five inches apart, and drill in the superphosphate in these rows with our grain drill, and then drop the potatoes in the row about fifteen inches apart. The English farmers plant potatoes closer than we do. In the Rothamsted experiment, the rows were twenty-five inches apart, and the sets dropped twelve to fourteen inches apart in the rows.

"Our farmers," said the Doctor, "are applying superphosphate to the corn in the same way. The best field of corn I have seen this year was drilled in with a grain drill in rows forty-two inches apart. The drill has a fertilizer attachment. No marking out was required. The seed and phosphate were sown at one operation, at the rate of ten acres or more a day."—"Yes," said I, "the plan is an excellent one. I know the field you allude to. It was sown early, and kept very clean by the frequent use of the cultivator. The corn is remarkably well eared, and was cut September 8-12—the earliest in the neighborhood. The old-fashioned method of planting by hand in hills, 'must go'."—"So must I," said the Deacon, and he left. He has strenuously opposed the plan of drilling in corn for years. And he is right, unless other improved methods are adopted at the same time—such as early planting, thorough cultivation, and the use of superphosphate in the drill. The superphosphate hastens the maturity of the corn crop.

Wintering Young Pigs.

Pigs born later than the first of October will need good care and skillful management to keep them in a thrifty, growing condition through the winter. This is particularly the case if you keep them in large numbers, and it is a good plan to sell all you can before winter sets in. People who keep only two or three pigs to eat up the slops from the house can handle their late pigs to better advantage than the large farmer or breeder. Such young pigs need milk, greasy water, or broth and bread, or cooked potatoes, with corn meal pudding; these are more likely to be liberally furnished from the kitchen when you have only two pet pigs than when you have two score or two hundred. Whatever method of feeding is adopted, let it be liberal. Let them have all the good feed they will eat—no more, no less. Let them have good, dry, comfortable quarters to sleep in, and disturb them as little as possible. Pigs are in part hibernating animals. The more they sleep the better for them and their owner. We do not want to fatten pigs in winter. We simply want to keep them in healthy, growing condition, and the fatter they are when winter sets in, the easier it will be to carry them through the winter. Pigs well wintered, are in good condition to thrive well on grass and clover next summer. They will do far better on pasture alone than young spring pigs. We are not now

advocating having young pigs come in the autumn, but if you have them and cannot sell them, or do not wish to, then take the best of care of them, and feed liberally. The most profitable pork we have ever made, was from young pigs which had been well cared for through the previous winter, and the next summer fattened on clover pasture.

Convenient Passage-Ways in Fences.

H. L. C., Strafford Co., N. H., sends us a sketch and description of his cattle way. When, he writes, we bought our farm, there was a common set of bars at the barn-yard, and one also at the en-

Fig. 1.—A CATTLE ENTRANCE.

trance to the pasture. These bars being wider than needed for admitting any team or vehicle, we set an extra post three feet from one of the fence posts, with slat and pin for holding the bars in place. By sliding the bars far enough to allow the cattle to pass through, we avoid the trouble of dropping the bars, and of stooping to raise them into place again. The boards are less likely to get broken by the feet of the animals. Figure 1 represents the upper bars nearly open, and the lower one closed. We have frequent occasion to cross, on foot, a lot where the boards of the fence are too near together to pass between them. We took off the middle board, pinned one end loosely to one of the posts, and placed a fastener or catch on the

Fig. 2.—A LOOSE BOARD.

other post, as shown in figure 2. In passing, we drop one end of the board, step through, and return the board to its place, with but little effort or delay, as illustrated in the engraving given above.

Underdraining in Winter.

Even when the thermometer was below zero, we have successfully and easily dug and laid tile drains. Two things are necessary; we must make our arrangements before winter sets in, and the tiles must be laid every day as fast as the underdrain is completed. It is usual to finish digging the drain before commencing to lay the tile. We dig from the outlet up into the field to be drained, and when the ditch is finished, we commence laying the tiles at the upper end of the drain, and work backwards, laying tile after tile, until we reach the outlet. When draining in winter, we cannot do this. We commence at the outlet, dig a few rods of drain, and lay the tiles, and cover them up. It comes a little awkward at first to an old ditcher, and some care, sense, good judgment, and pluck are necessary. But the work can be done, and done well. We speak from experience. If you find water in the land, and the outlet below is free, there need be no fear of laying the tiles too deep or too shallow. The water will give you the true level. All you have to do is to cut the drain so that the water will pass off through the tiles below. If the land is nearly on a dead level, and you are anxious to get every inch of fall, you can cut the drain so that the water, before the pipes are laid, will stand in it nearly an inch deep. If horse-shoe tiles are used, this is not necessary, but with pipes you must allow for the thickness of the pipe at the bottom of the drain. We said it is necessary to make preparations before winter sets in. In the first place, make up your mind just where the drains are to be cut, and stick stakes.

Then commence at the outlet, and with a good three-horse team plow two furrows at least two yards apart on each side of the proposed drain, and keep plowing, turning haw at the end, until the whole is plowed, and you have a good, deep, dead-furrow in the centre where the drain is to be cut. If it is stubble land, it is a good plan to plow this strip two or three times over, turning the furrows away from the centre every time. In this way you can break up the land where the drain is to be cut at least eighteen inches deep. The loose earth will fall back again into the centre, but if it does not, keep plowing until you have at least eight inches of loose earth on the surface of the land where the drain is to be cut. The object of this plowing is not merely to lessen the labor of digging, but to furnish a mass of loose soil that will not freeze. To accomplish this object, the work must be thoroughly done. The earlier you plow in the autumn, the better, but the final plowing should be just before winter sets in, or better still, after there is an inch or so of frozen crust on the previously plowed land. A couple of men following the plow, will pull on one side, with potato hooks, large chunks of frozen earth, and thus enable you to plow deeper in the centre where the drain is to be. In the winter, even when the rest of the field is bare, there will probably be snow in this deep, dead-furrow, and when it is shovelled off you will find loose earth beneath, or at worst, only a slight crust of frozen earth that can be easily broken up.

Bare-back versus Blanket Saddle.

As a boy I could throw myself on a horse, and with a withe-bridle go almost anywhere, across ditches, over fences, etc., and rarely thought whether the horse was fat or lean, or high or low withered. I do not remember ever being much troubled by the chine of the back-bone. But now I need a saddle. There were two of us to ride the other day, and only one saddle; so a saddle had to be improvised. I remembered that the cavalrymen used to fold a blanket so as to make a comfortable seat. I tried my hand, and I think hit it the first time. The horse was far from fat. The blanket was first folded narrow and smooth, about fourteen inches wide; the exact middle marked, and the ends rolled rather tightly to the centre. This rolled blanket was laid rolls down upon the back of the horse, one roll being on each side of the back bone, as shown in the engraving. A saddle-cloth, a sack, or a blanket may be laid over it, and strapped on with a good, strong surcingle. This furnishes a broad, level, easy seat. To make the saddle complete, a leather girth is needed with stirrup straps, and stirrups attached; also a breast strap, made of a piece of surcingle webbing, connecting with the girth between the forelegs, and

AN IMPROVISED SADDLE.

having its ends sewed together and attached to the girth at the withers by a buckle, or by two short straps and buckles on each side. A back strap and crupper may be buckled by the girth. This makes a safe hoy's saddle, which would be hard to beat for comfort or safety while riding. W.

HOLD ON TO THE SHEEP.—The depressing tendency of the wool market is apt to influence many sheep-raisers to get rid of their flocks at any price and go out of the business. We believe those who do this will miss it. Every business has its low tide, but it will surely rise again, and they who hold on to their sheep will be gainers in the end. The farmer or stock raiser should not be fickle.

The Old and the New in Canaries.

The wild canary, as shown in figure 1, is found in Southern Africa, and many islands of the Atlantic Ocean. It is stated on good authority that these birds found their way to the Canary Islands

Fig. 1.—THE ORIGINAL WILD CANARY.

Engraved for the American Agriculturist.

by accident—being set at liberty from a foundered ship bound for Leghorn. The genial climate of the new home proved well suited to the island-bound canaries, and they became thoroughly acclimated. From these islands, whose name they now bear, the beautiful songsters have been carried to all parts of the civilized world, and are esteemed as household pets by all classes, from the humblest cottager, to the queen in her palace. The common canary is a handsome bird, varying in color from yellow to buff and green, and is often variegated.

Under domestication, and the guiding minds of breeders, several distinct varieties of canaries have been produced. Among these, the Belgian, the Glasgow Don, Manchester Coppy, Yorkshire Fancy, Cinnamon, Lizard, and London Fancy, are leading types. Much attention in recent years has been given to the Crested Canaries, and a short time ago a new variety was originated by crossing the true type of Norwich Canaries, with the Lancashire Coppies. This Modern Crested Norwich Canary is shown in figure 2. The changes which have taken place in the production of this household pet, are indeed striking, as seen by comparing the original canary in figure 1, with the recent product of skillful breeding, shown in figure 2. The modern canary is full in the body and head, deep and broad-chested, short in the legs, wide across the shoulders, and with a moderately short tail. The crest is the most attractive and important feature, which is shield-shaped, wider at the back than at the front.

What shall we do with the Crops?

A distinguished bank officer and financier asked us to-day the above question. He thought the country, and in fact the whole world, was groaning under a load of agricultural produce, for which there was no present or prospective demand. Do not be alarmed, we said, we are better off than we were last year. Farmers are hopeful and are busily at work, confident that as long as people must eat, the products of their labor will be wanted. Let us be thankful for good crops. They are a great blessing. We know that low prices entail suffering and disappointment on individual producers. This is true of farmers and manufacturers alike, but the farmer has this great advantage, he can live to a large extent on the products of his own

farm, and he knows that the world cannot live a single week without wheat and other soil products.

"That is all very well and very true," he remarked, "but I do not see what can be done with the present large surplus of wheat?"—In the first place, we said, the surplus is probably exaggerated. At this season of the year, when the wheat is in the farmers' hands, there are more "Bears" than "Bulls." They wish to get prices down as low as possible, and many of the papers teem with articles calculated to induce farmers to accept any offer made them for their produce. Even admitting that there is a large wheat crop all over the world, it must also be remembered that prices are extremely low—far below the cost of production and reasonable profit, and it is a well known fact that low prices greatly increase consumption. When prices are high we get along with as little as possible, we are careful to waste nothing. Now, if the bread is not just what we like, it goes into the swill-tub. If we cut a larger slice than we eat, no matter, bread is cheap. If a favorite dog looks at you while eating, you do not hesitate to share with him. If the cook does not object to the extra baking, you do not care if the pigs or the chickens, the ducks, the geese, or the turkeys, get more or less bread. On the writer's farm we have a large lot of poultry that are fed by the juvenile members of the household, and fed so liberally that they will not look at rye or common screenings. Nothing but Gold Medal Wheat, or the best Clawson, suits their fancy, and they are to-day getting, without serious protest, all they will eat of it. If wheat was one dollar and fifty cents per bushel, not a kernel would they get.

In addition to the bread and wheat which the pigs and poultry get incidentally as a result of cheapness, there are many places where wheat will be purposefully, and as a matter of convenience and economy, fed to stock of all kinds. There is very little old corn in the country, and wheat is taking its place.

This condition of things exists more or less throughout the world. Wheat is very cheap, beef, mutton, pork, butter, and cheese, are high, and there is no law, human or divine, against converting the low priced article into the high priced article. If it will pay the thing will be done. As

a rule it does not pay to raise wheat to feed animals, we can get cheaper food. But if, once in a century or decade, wheat falls so low that it can be more profitably and more conveniently disposed of in this way, wheat will become the staff of life for man and beast alike. We have as yet scarcely touched the wheat of the past harvest. The world eats a good deal of bread every day, and there are three hundred and sixty-five days till the same time next year, when, if the harvest of 1885 is as early as it was this year, we may hope for more. Until then we must live on the present supply, and happy should the world be to know there is no deficiency.

In all sober seriousness, what is there in the situation to call out such doleful prognostications of impending disaster? If the crops were poor should we be richer? Wall street may have cause for fears, speculators may come to grief, railroads may lose money, but the agricultural interests of the country are, on the whole, safe and prosperous. Let us be thankful for the abundant grain crops.

Keeping Onions.

The great point in keeping onions through the winter is to get them dry and keep them dry and cool. A damp, warm cellar is one of the worst places. If you do not want to use them until spring, a good place is to put them in a dry barn or loft, and cover them over with straw or hay a foot or more thick, and let them freeze and stay frozen until they thaw of their own accord. They should not be handled while frozen, unless you wish to use them immediately. We have kept onion sets by mixing them with dry malt-sprouts, say not less than one bushel of sprouts to a bushel of sets. We placed a layer of sprouts two inches deep at the bottom of a large bin, and then a layer of sets four inches deep, and then two inches of sprouts, and so on until the bin was full, when we placed a foot or so of sprouts on top. The bin was in a hay loft, where it was exposed to frost. In the

spring the sets came out in the most perfect condition—none decayed and none sprouted. Coarse, dry bran, would answer the same purpose. We once threw a quantity of onions by the side of a row of evergreens, and covered them with straw thick enough to keep them dry. They remained there all winter and came

Fig. 2.—THE MODERN CRESTED NORWICH CANARY.

Engraved for the American Agriculturist.

out in good order in the spring. A good plan is to keep the onions in slatted boxes holding a bushel or less. Place these boxes in the cellar on shelves, or raised a few inches from the ground, and with spaces between the boxes for air to circulate.

Fruit Without Flowers.

A fruit is defined as the ripened pistil of a flower, and whatever remains attached to it. Perhaps no more exact definition than this could be given. There are, however, bodies occasionally produced, which have the sensible qualities popularly regarded as belonging to fruits, such as juiciness, sweetness, taste, and odor, yet are not the ripened pistil, or any other part of a flower.

Fig. 1.—GROWTH FROM A WOUND.

in which the end of the flower stalk becomes edible, though this is really a part of the flower. Figure 1 represents the stem of an apple, in which a bud had been inserted in the ordinary manner at A. An irregular growth took place from the wound, and a mass of cellular tissue produced. A skin was formed upon the surface of this, and in time it became of a yellow color, juicy, with the flavor, and even the perfume of a fruit. In another apple tree, figure 2, what might have been a bud, developed into a body somewhat like a fruit in form, but attached by its side. This, when it attained its growth, had all the sensible qualities of a fruit. Figure 3 shows growths that appeared on a Napoleon pear tree. These were adherent

Fig. 3.—FLESHY GROWTH.

to the wood, and each terminated by a leaf. They were fleshy and homogeneous, and though green and insipid at first, they became yellow in time, and acquired the peculiar flavor and odor of the Napoleon pear in a marked degree. The Poire

Guillaume, or Williams, of the French, is our widely known Bartlett. Figure 4 represents the peculiar development of a leaf bud upon a tree of this variety. This, to some degree, is fruit-like in form, and adherent to a twig for part of its length. Some undeveloped leaves at the upper end, and other leaves at the sides, indicate its real nature, namely that of a stem. The flesh and taste of this growth were exactly like those of the Bartlett.

Notes From the Pines.

My little vineyard was planted some eighteen years ago. It contains about fifty varieties. I selected the kinds that were held in the highest esteem at the time, and others because I wished to know more about them. The soil on which they stand is very poor and sandy, yet with an occasional dressing of fine bone, the growth and crop are very satisfactory. The newer varieties that have since appeared, have been planted elsewhere.

WHAT IS THE BEST GRAPE?

If asked what is the best grape of the fifty odd varieties, I should unhesitatingly say the Alvey.

Fig. 2.—A PECULIAR "FRUIT."

That is the best fruit, without reference to anything else. It is to my taste as near perfection as I hope to meet with. Would I advise planting it? Not at all. The crop is never large, sometimes fails altogether, and the bunches are small and irregular. In every other respect, save in the supreme quality of the fruit—when you get it, the variety is altogether unsatisfactory. Next in quality I class the Iona. What great expectations there were when this was introduced! Yet who plants it now? My one plant has always given a fair crop, and the fruit is of the very highest quality; it would no doubt please the majority better than the Alvey. Israella, the former companion of the Iona, proved utterly worthless with me, and I am glad it died. On the other hand, Eumelan, which we seldom hear of now, is here one of the most reliable and satisfactory of all the varieties. It bears abundantly, has a good bunch, and is of excellent quality. When it can have a long enough season to become perfect, it gets very black, but it is eatable when the berries are only reddish-purple.

WHICH IS YOUR EARLIEST GRAPE?

In point of earliness, the Creveling takes the lead, and the fruit is of satisfactory quality. But it never makes a good bunch. Those who care nothing for appearances, and do not mind ragged clusters, will be pleased with the Creveling. Following close upon it, comes the Adirondack, another variety that appears to have been forgotten. It is, with me, a grape of much merit. Almost as early is Lindley, a red Rogers' Hybrid, which is a very sweet grape, and a favorite with many. Barry and Wilder are two of Rogers' black grapes. Both have every good quality that is claimed for the Concord, are of vastly better quality, and unlike that variety they keep well. They do well generally, and it is strange they are not more planted. They are much better for "the million" than the Concord. The Salem, another of Rogers' has been much praised. With me it has done

nothing until this year, when it has a small crop. Lady does well here; it is a very handsome white fruit of good quality. One bunch of it is worth a bushel of Martha. Croton is another white grape

Fig. 4.—A STRANGE PEAR.

which makes a long loose bunch. The quality excellent, and when the mildew is not too much for it, a good bearer. Among the grapes the berries of which are too small to be popular, and the mildew is especially fond of, is the Elsingburgh. It illustrates the adage, "the best things are in the smallest parcels." Some one who described the berries as "little hags of wine," made a happy hit. It is a most welcome fruit when it ripens well. The Herbemont, smaller yet, is too late. I keep the vine just for its beauty of foliage. The same with the Taylor, one of the most rampant of all growers. If one wishes a vine for shelter, or to cover a screen, let him plant the Taylor. I have before mentioned that the Ives, so generally successful elsewhere, had never borne a ripe cluster here. It is the same this year, not a berry of the whole crop that is not shrivelled, cracked, and utterly worthless. Among the grapes that one now seldom meets with is the Hine. It resembles the Delaware in many respects, but has a somewhat larger berry, and to my taste is preferable, as it has not the cloying sweetness of that variety. It is an excellent amateur grape. THE PINES.

A Universal Screen.

The engraving represents a wire screen for sifting sand, coal ashes, soil and peat, for compost and any similar purpose. The frame is of two inch pine planks, six inches wide and six feet long, the cross piece at the top being three feet long, or as long as the wire cloth requires. The corners are stayed by corner pieces, or by an inch board nailed across the top. The woven wire is attached by staples before the bottom cross-piece is nailed on. The wires should not be closer than two to the inch—that is, half an inch apart, including the thickness of one wire, and it is well to use the galvanized wire-cloth. In use this screen

A SCREEN FOR MANY USES.

may be set against a building, or braced up so as to stand by itself. It is often convenient to set it up in a sled or wagon body, so that the coarse stuff shall fall out over the tail-board, while the fine material, sand, loam, peat, or what-not, may fall inside the box. In unloading potatoes, if the screen is hooked or fastened to the back of the wagon; the potatoes may be shoveled out quite rapidly, and the dirt will all sift through. The one we have had a long time in use has paid for itself over and over again, and been employed in many and varied ways not now remembered by us.

A German Mailing Box for Plants.

We reproduce for the *American Agriculturist*, engravings from the "Gardener's Chronicle" (Eng.), of a box used by Germans in mailing plants. The box consists of two pieces of pasteboard, which are dipped in hot water and brought into the form shown in the engraving, by shaping upon a mold.

Fig. 1.—MAILING BOX OPEN.

Within the box is a loose frame made of four pieces of thin stuff, fastened together at the corners (fig. 1). The plant is placed within the frame, and the halves of the box tied together by a string. We would suggest that the box might be greatly improved by giving its interior a coat of shellac

Fig. 2.—MAILING BOX CLOSED.

varnish. This would not only make the box stiffer, but by rendering it air tight and non-absorbent of moisture, would greatly aid in preserving the plants it contained. Figure 2 shows the box closed.

Law for Farmers.

THE FARMER'S LIABILITY TO HIS HIRED MEN.—In a former article the law regulating the relation of master and servant, so far as applicable to the hiring of farm hands, was briefly stated. We now consider the obligations of the farmer to hired men, which are independent of the contract of hiring.

THE EMPLOYER'S DUTIES.—There are certain general duties of a master to his men, which, if not faithfully performed, render the master liable for the injury resulting to the men from such failure: 1. To exercise due care in the hiring and retention of employees. 2. To exercise due care in the purchasing and retention of machinery. 3. To exercise due care in keeping his buildings and premises in safe and proper condition. 4. To exercise due care not to expose his men to other than the ordinary risks of the business for which they hired. These general duties of the last group fall naturally under the following heads:

INJURIES BY CARELESS FELLOW-WORKMEN.—One of the risks which a workman assumes when he engages in any employment, is that which arises from carelessness on the part of his fellow-workmen. If two farm hands, both presumably competent, are set to work together, and one carelessly injures the other, the injured workman has no claim therefor upon the master. But if the master failed in the first duty above set forth, *i. e.*, if he hired a man whom he knew to be incompetent, or if he did not exercise due care to ascertain that the man was competent, then he, the master, would be liable for injury suffered through such incompetence by another workman, without fault on the part of the latter. To illustrate: Suppose a farmer hires a careless boy, and sets him to driving a spirited team; if the boy by his carelessness allows the team to run away and injure another workman, the farmer will be liable. He has here failed in his duty to exercise proper care in the selection of his employees. But if he had used the caution of an ordinarily prudent man in selecting a person com-

petent to drive the team, and the man so selected had still proved careless and allowed the team to run away and injure a workman, the master would be relieved from liability for the damage done.

INJURIES BY DEFECTIVE MACHINERY, BUILDINGS, ETC.—The second and third duties of the master require him to exercise care in the purchase and retention of machinery, and in keeping his buildings and premises in a safe condition. If he fails in these duties, and such failure results in injury to a workman without negligence on the workman's part, the master is liable for the damage done. But here it must be observed that if the defects in the machinery or buildings are open and perfectly apparent to the workman, so that by the exercise of care on his part he can avoid the dangers arising from them, he cannot recover damages if he is injured in consequence. By engaging in the employment he voluntarily encounters the dangers which he can see, and, by prudence, avoid. Many of the defects, however, in machinery and buildings, are of an unseen and latent character, and not apparent to the ordinary observer. The servant does not, and cannot be expected to investigate at every step to know that he is treading on safe ground. If he is injured by reason of such a defect, and the defect is known, or ought to be known to the employer; that is, if ordinary care and prudence on his part would have discovered the defect, the master is liable. This is well illustrated by a case in New York, where a portion of a mill fell because the timbers and supports under it were allowed to become defective. The Court held that ordinary care on the part of the owner required him to find out such defects and remedy them, and that failure of this duty rendered him liable to the injured operatives (24 N. Y., 410). Where latent defects are known to the servant, and he calls the master's attention to them, and the master promises to repair them, that is sufficient for the servant. He may then continue at the work, and if he is injured the master will be liable (106 Mass., 282).

RISKS NOT INCIDENT TO THE EMPLOYMENT.—As has been stated, when a man engages in any kind of business he voluntarily assumes all the ordinary risks and dangers incident to that business. Thus a sailor takes the chances of wind and wave, a miner the risk of being choked by fire-damp, a builder that of falling from the scaffold, or a painter the chances of getting the painter's colic. All these ordinary risks are presumed to have been considered in making the contract of hiring and the compensation to have been arranged accordingly. If an injury results from one of them to the workman, it can only be regarded as an accident, and the misfortune must follow him (28 Vt., 59). But the employee does not undertake to run any risks not incident to the employment for which hired; and if he is put to other work, and is there injured without fault on his part, the master is liable. To illustrate: Suppose a farmer hires a man to work on a farm; the man after working for a time on the farm is, without any new contract, put to work in a saw-mill which the farmer also owns. Not being used to the work, he is injured by one of the risks incident to the latter employment, the farmer will be liable for the damages caused by the injury. It is true the man could have refused to work in the mill when requested to do so; but his primary duty was obedience, and he undertook no additional risk by obeying the master's orders.

Treating Diseased Fowls.

In nine cases out of ten, and often in the tenth case also, an axe properly applied, with the aid of a chopping block, is the best medicine that can be given a diseased fowl, and it prevents that one from spreading contagion. Unless the bird or birds are very valuable, it seldom pays to doctor them when they are ill, as it is tedious and troublesome, while the results are always uncertain. Among fowls under proper care, it is seldom that disease makes its appearance. Disease is the result of a cause, and if the cause be removed, the trouble will not spread, provided the diseased

fowls be at once separated. If what is expended in dosing and care, as well as what is lost from disease, was devoted to making better sanitary arrangements, and in preserving cleanliness and purity in and around the poultry houses, much more satisfaction would be the natural result.

A Spring Wheelbarrow.

The illustration shows a readily and cheaply constructed spring wheelbarrow. Instead of the spindles of the wheel passing through the ends of the handles or side pieces, straps of spring steel—old pieces of steel tire or springs will answer, are fastened to the under side to receive the spin-

A WHEELBARROW WITH SPRINGS.

dles. The pieces of steel are bent downward, to give the necessary spring. Any blacksmith can soon change an ordinary wheelbarrow to one of this kind. It is often desirable to have some spring in the barrow, as in hauling fruits, when too much jarring will be apt to do injury.

Rabbits in Australia.

One of the greatest obstacles the Australian farmer has to meet is the multitude of rabbits, which have increased to such an extent, that their numbers are beyond all computation. How to get rid of the rabbits, is a problem which presents itself to the Agricultural Societies, and the Colonial Legislatures. Moderate bounties, about eight cents per head, have been offered for their destruction, but the evil shows no manifest abatement. The principal methods of killing the animals are by poison, by suffocation, by "nesting," or digging out, and by trapping. The poisons most commonly used are arsenic and phosphorus, applied upon oats or other grain. But as the rabbits will not eat the poisoned

AN UNEXPECTED VICTIM.

food if any other is to be had, this method, though it destroys many, is somewhat uncertain. Suffocation is effected by the means of the fumes of burning sulphur. Several contrivances have been invented for forcing into their burrows, the gas produced by burning brimstone, and killing the inmates by wholesale. Digging out is more laborious than the other methods, but is very effective, as a score or more of rabbits, old and young, are often secured in one hole. A dog is in attendance to give chase to any of the animals that may attempt to escape. Trapping, though one of the slowest methods, is more like sport than the others, and for this reason is attractive to many. The engraving on opposite page presents scenes incidental to the trapper's pursuit. In figure 1, the trapper is starting out with a back-load of traps, one of which he has set in figure 2. In figure 3, the trapper is visiting his traps by night, while a view of the trapper's camp is given in figure 4. Australians are on the look-out for methods of utilizing the fur, skins, fat and flesh, that by rendering the trapper's labors more profitable, may make the work of destruction more rapid and thorough.

THE RABBIT TRAPPERS OF AUSTRALIA.

Re-grouped and Re-engraved for the American Agriculturist after the Illustrated Adelaide News.

What is a Bushel of Indian Corn?

W. E. STONE.

The measure of a hushel is commonly accepted as a fixed and indisputable quantity. It is based upon national standards which have existed in England since 1696, and in America from the first colonial settlement. As a measure of bulk this so-called Winchester bushel contains 2150.42 cubic inches of water. So far then the capacity of the measure is well defined and unchangeable. So many cubic inches of any material is always a measured bushel. But this quantity, though always identical in bulk, may vary greatly in weight, therefore a bushel of corn is by no means a definite quantity, and may have so wide a range of actual value that every person who produces, handles, or consumes the grain, is interested in the query which stands as the title at the head of this article.

In commerce a fixed weight is used as the equivalent of the measured bushel, but this varies so much in different States that it fairly illustrates the uncertainty surrounding the whole matter. By different statutes the legal bushel of barley weighs from 47 to 50 pounds; of buckwheat, from 40 to 52 pounds; shelled Indian corn, 52 to 58 pounds; oats, 30 to 34 pounds; rye, 50 to 56 pounds, while wheat alone remains constant in all the States at 60 pounds. The term hushel, therefore, does not express any definite quantity in weight even though the volume remains fixed. But the chief and real fallacy of this unit of grain measure, both in weight and volume, appears when we consider the composition of the product measured. We shall show that the proportion of water and solid matter in the grain, varies to such a degree that no unit of measure is accurate which fails to allow for the variation.

All grains in their natural state contain more or less water, the amount depending upon the conditions by which they have been surrounded. In Indian corn the moisture may reach as high as fifty per cent, and probably never falls much below twenty per cent at the time of harvest. Unfortunately but little is known of the exact composition of grains as they come from the harvest field. All published analyses give the moisture content as the sample came to the chemist, but usually omit to state its age or manner of curing. Professor Brewer's special Census Report on the cereals, gives 98 analyses of all varieties of Indian corn, having an average of 11 per cent of water, with a range of from 4.10 to 20.08 per cent, but most of the samples were undoubtedly taken from well cured corn.

The curing process of Indian corn has been made the subject of careful experiment at Houghton Farm. Samples are selected at the harvest from each of the thirty-one experimental corn plots, and being grown with as many different manures, represent a wide range of composition. These samples are then stored upon suspended racks and under conditions which allow of rapid drying, and weighed at regular intervals during the succeeding year.

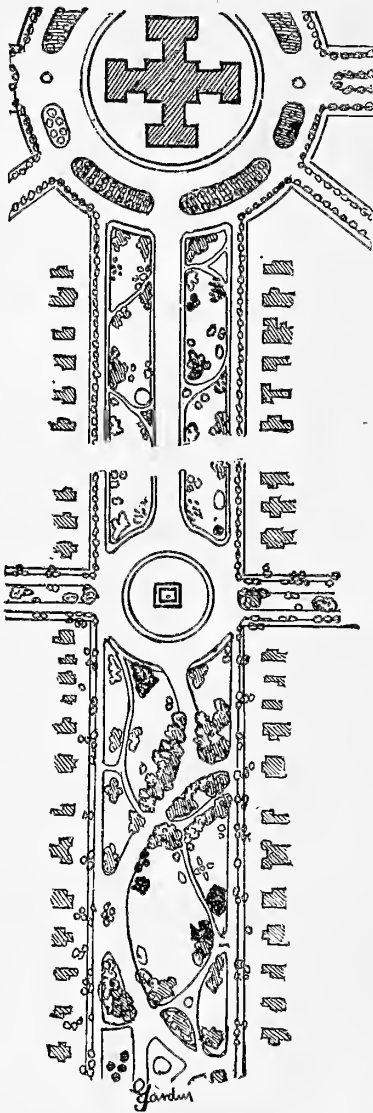

The observations of three years have been but a repetition of the fact that this grain continues to lose moisture under natural conditions for at least a year after harvest, *i. e.*, it requires a full year to reach what may be called a thoroughly cured condition. The following table shows the percentage of loss in weight of Indian corn at each of the specified times since the previous weighing:

	Harvest to March.	March to July.	July to Oct.	Total
Crop of 1881....	7.4	...	4.0	11.4
Crop of 1882....	3.5	7.9	4.4	15.8
Crop of 1883 ..	4.3	9.8

Complete data on the crop of 1883 have not yet been secured at the time of writing.

There is a loss of from 10 to 15 per cent of moisture during the year, and a weighed bushel at the end of this time contains this amount of moisture less and an equal quantity of solid matter more than the weighed bushel at harvest, yet the legal weight, 56 pounds in most of the States, remains the same for both conditions. The only departure from this occurs in Ohio, where a legal bushel of corn on the ear weighs 70 pounds

from harvest to January 1st, and 68 pounds from that time on. At Houghton Farm, the 31 lots before mentioned, selected from the crop of 1882, gave, in December following the harvest, an average weight per bushel of 54.1 pounds. The following April, bushels from the same lot averaged 52 pounds; in July, 53.4 pounds, and in October, one year from harvest, 55.4 pounds. The crop of 1881 was followed through a similar series of changes, and averaged 55.5 pounds per bushel, one year from harvest; hence Indian corn does not reach a standard weight per bushel, until after a year's drying. In business this is important. The increase of two pounds from July to October, was

A GARDEN BOULEVARD.

a gain of 3.7 per cent in value, if sold by weight, but not taken into account if sold by measure.

But we only arrive at the pith of the matter, when we consider the actual amount of valuable dry matter in the grain. This is the only true basis of value. It is fixed and unchangeable from the time of harvest, while the percentage of water decreases up to a certain point, and even then constantly fluctuates with the changes of weather, which Professor Brewer found by comparing a large number of analyses covered a range of 7 per cent.

Well cured Indian corn contains from 10 to 13 per cent of moisture, or in the bushel of 56 pounds, there are about 50 pounds of dry matter. The 31 lots which, after drying a year, averaged 55.4 pounds per bushel, contained 12.87 per cent of moisture, or 49.3 pounds of dry matter per bushel. The previous July, when the average weight was 53.4 pounds to the bushel, there was 14.91 per cent of moisture, or 45.4 pounds of dry matter. In April preceding this, the average weight per bushel was 52 pounds, with 19.65 per cent of moisture, or 41.8 pounds of dry matter, and the previous December, two months from harvest, the average weight per bushel was

54.1 pounds, with 22.73 per cent of moisture, or 41.8 pounds of dry matter. The year old corn was of standard quality, the others were not, therefore we will use it as a basis of value with which to compare the others. For illustration, let the standard be worth 60 cents per bushel, or 1.1-5 cent per pound for the actual dry matter; then a bushel of the same corn was worth only 54.5 cents, the previous July, 50.2 cents in April, and the same in December following the harvesting of the crop.

In business, no such variation as this is recognized, and more often no account whatever is made of the difference in value which may exist at different stages of curing. Indeed, 56 pounds of corn is as truly a legal bushel at one stage of the curing as at another. Both law and commerce overlook the fact that the value of the grain depends upon the percentage of dry matter, yet the above figures show the actual facts. It would be perfectly feasible to arrange a scale of values for corn of different ages, based on this principle, since the process of curing seems to go on with great uniformity for different years. Our careful observations for three seasons show but little variation in the degree of dryness, at corresponding times of each year.

Planning and Improving Towns and Villages.

Very few of our towns and villages were built up according to a plan. They grew to suit the convenience or the necessities of the early settlers. The crookedness of the streets in some now large cities, is due to following the course of the early country roads and farm lanes. Towns and villages start from a main street, upon both sides of which houses are built; after a while, when the distance from the older to the more newly settled portions becomes inconveniently great, streets are made parallel with the first, with cross streets to unite them. Sometimes a prosperous town that has been begun in this manner and grown to a large size, proposes to add to its attractiveness by establishing, at a heavy cost, a public park, which is frequently, to secure cheap lands, situated too far from the dwellings to be useful to the inhabitants.

Such towns, instead of being at a heavy expense to construct a park, mainly for the benefit of future generations, should consider that form of improvement known as Garden Boulevards. In the diagram Mr. Elias A. Loug illustrates this style of town improvement, of which he says: "The engraving shows a garden boulevard four hundred and thirty feet wide, with great and small circles, and narrow boulevards and streets, that open into it of two hundred, one hundred and fifty, and one hundred feet in width. The plan shows two styles of laying out: the lower part in the park, and the upper in the avenue style. But in both, the natural style of arrangement mostly prevails. In addition to the main garden drives, there are walk-bordered roadways for traffic along each side, and into which private walks and drives open. Such an avenue garden, extending for one or any number of miles through a town, with wide circles at central points, supporting town halls, art galleries, museums, conservatories, or other edifices, and small circles at junctions with streets, containing monuments, statuary, or fountains, present an array of fine qualities difficult to equal. Add to this the area that on each side throughout the length, is embraced by private grounds, with residences setting back, let us suppose, at an average distance of about thirty feet, and altogether a garden is presented in effect, about five hundred feet wide from house to house, and stretching far away, which for grandeur, richness, variety, and healthfulness, stands unequalled by any other kind of town garden."

It may be thought that an improvement like this might be adopted in the newer parts of the town, but that it would be too costly to carry it out in the older and more densely settled portions. In answer it may be said that in cities where equally radical changes have been made, the increased value in the neighboring property has more than covered the cost of making the changes and improvements.

Bee Notes for November.

W. Z. HUTCHINSON.

Contract the entrances to the hives so that mice cannot enter. If the bees which are to be wintered out of doors have received no protection, furnish it at once. Have everything in readiness if they are to be wintered in a cellar or a "clap." When it is evident that the bees have enjoyed their last autumn flight, carefully carry them in.

BEE-KEEPERS' CONVENTIONS.—Now begins the season of bee-keeper's conventions; and, if not too distant, it will pay to attend one or more of them. Before deciding to go, however, let the bee-keeper consider whether it would not be more profitable to invest the money it would cost in bee-keeping literature. The social feature of these gatherings is perhaps the most interesting part. To greet those whose writings we have read so long is a pleasure. The most instructive gathering the writer ever attended were conventions of two. The best way to learn about bee-keeping is to visit a successful apiarist at his place of business.

SELLING HONEY.—Small fruits and flies are now gone, the cooler weather excites the appetites for sweets, and if your honey crop is not sold, now is the time to dispose of it. The local market should be looked after first, and no honey sent to the distant markets until the local demand is supplied. When honey can be sold at home for three cents less than the quotations of large markets, it is, as a general thing, more profitable to sell it at home. If there is no local market, make one; if you have never tried, you will be astonished at what can be accomplished by a little push. Honey should not be "kept over" in hopes of receiving better prices, as old honey is not preferred to that which is new.

REVERSIBLE FRAMES.—The apicultural world is now somewhat agog upon the subject of reversible

A REVERSIBLE FRAME IN POSITION.

frames, that is, frames that can be inverted and used either side up. It is the instinct of the bee to store its honey above and as near to the brood nest as possible. When the combs are inverted, the bees proceed to remove the honey from the lower cells, and store it in the surplus boxes above, depositing brood in the cells thus emptied. When the brood hatches out in the upper part of the combs, its place is again occupied with honey; but, if the combs are reversed just before the close of the white honey harvest, nearly all of the white honey will be removed from the brood-combs to the surplus boxes, in which it can be sold at a good price. If there should be a flow of honey in the fall, the combs can be again reversed near the close of that harvest, and the brood-combs will thus be left at the end of the season nearly destitute of honey, and sugar syrup can be fed for winter stores, without the trouble of extracting honey at a time when robbers are especially annoying. Another advantage gained by reversal is that it induces the bees to finish out and attach the combs to the bottom bars, in the same substantial manner in which they are attached to the top bars. Many of the reversible frames now in use are not hanging frames like the Langstroth, but rest on the bot-

tom of the hive upon metal projections attached to their corners, or upon elongations of their end bars. Reversible frames of this style are held at equal distances apart, and thereby lose a most valuable feature, that of being movable laterally. Numerous devices for allowing the reversal of hanging frames, such as tin corners, that can be drawn out or slid back at pleasure, wire loops, tin corners hung on pivots, etc., have been invented; but, as yet, nothing of the kind has been given the public that it is inclined to adopt. We received for inspection, a few weeks ago, from a gentleman in Missouri, a sample of a reversible frame, that is both simple and ingenious, as well as having the appearance of being practicable. It is a hanging, laterally movable frame, but instead of being hung by projections of the top bar, it is suspended by four projecting prongs of folded tin, two of which are attached to the sides of each end bar at its centre, and rest upon a strip of tin nailed to the inside of the hive, the upper edge of the tin being slightly bent out.

The prongs upon the nearest side of the frame are shown at *a, a*, in the engraving. If the prongs are spread apart slightly, it will give the frame a broader support. It will be seen that the comb can be used either side up very readily. By using the Langstroth frame, which is so shallow as to allow but little honey to be stored above the brood-nest inside the brood-frames, contracting the brood-nest and keeping the queen in it, by using a queen-excluding honey-board, we have succeeded in having so little honey stored in the brood-combs, that we have not yet thought it advisable to adopt reversible frames. Should we ever conclude to do so, however, it would be those of the hanging, laterally-movable style we have described.

The Ox Bot-Fly.

The Ox Bot-fly or Warble Fly (*Estrus bovis*), is a serious pest to cattle. It has been carefully estimated that there are three-fourths of all of our cattle yearly tortured by this inveterate insect, which by a little trouble and at a small outlay could be extirpated. This fly, shown in figure 1, is about the size of the closely related bot-fly infesting horses. The female deposits small, oval eggs upon the hair or skin of its victim. The maggot, after hatching, makes its way into the lower portion of the skin. Small bands of prickles soon form on the maggot, and the most harmful portion of the insect's life now begins. The movements of the rough surface of the grub cause local irritation, followed by swelling, ulceration, and the opening of an orifice in the warble. This is the stage when the parasite should be destroyed. A small quantity of mercurial ointment, placed on the opening of the warble, kills the maggot within. This remedy is equally effective later in the life history of the warble, but if killed early, much suffering is avoided. Some preventive measures may be taken when the mature insects are depositing their eggs. The flies are usually on the wing at noonday, when the sun is shining. It is therefore desirable to provide a cool shade or shelter at midday. A tethered animal is more frequently attacked than one that is free to escape from the bot-flies. The coat of the animal may be

Fig. 1.—THE OX BOT-FLY. Fig. 2.—CHRYSIDALS.

smear with grease, sulphur, and other substances not agreeable to the flies. These preventive measures are generally disregarded, and therefore the early destruction of the maggots with mercurial ointment is urged. The amount of damage done to the hides is great, when the warbles are permitted to run their full course. Chrysalids of the ox bot-fly are shown in figure 2. They are dark-brown, and not very unlike the maggot in shape.

Stone and Iron Gate Posts.

We herewith present a plan for gates to a gentleman's place (where stones are plenty), which is both effective and efficient. The drive-way is nine feet wide, the posts are laid up with stone and cement mortar, in the style known as "broken ashler," and well pointed and capped. The gates are of one-inch gas-pipe, made by uniting two five-foot pieces by T unions, in the manner shown in the engraving, or simply by "elbows." They should be about sixteen inches apart. These slide through the posts in pieces of larger pipe, which go entirely through the posts and are given a slight slant to the outside. The

A GAS-PIPE GATE WITH STONE POSTS.

lower parts of the gate-frames rest upon a flat stone in the center. These gates slide easily, and exclude animals, while one gate slides to admit persons on horse-back. If there is much passing in and out on foot, the gates may be brought together within a foot, and be prevented from opening wider by a chain and hook, easily removed. The same general plan can be carried out with wooden posts—setting two in place of the single heavy stone pier—to support the large gas-pipes in which the gates slide.

Coarse Fodder for Sheep or Cows.

A correspondent of the *American Agriculturist* proposes to buy stock to eat up his straw, corn-stalks, bean and pea-straw, and clover hay, and asks which will be most profitable and make the best manure? Sheep will make the most manure. If the cows are giving milk, the manure will lose the nitrogen, phosphoric acid, and potash, carried off in the milk. But you can sell this nitrogen, phosphoric acid and potash in the milk at a high price, and buy it at a comparatively low price, in the form of hay, mill-feed, cotton-seed cake, brewer's grains, malt-sprouts, etc. Whether sheep or cows will be most profitable, all things considered, will depend on your conveniences for carrying on the work, or the kinds of coarse fodder, and on the demand and price of milk at the farm, and what you propose to do with the cows after your fodder is exhausted.

Farrow cows that are giving milk, can often be bought cheap. If fed liberally they will give rich milk, and improve in flesh at the same time, and sell in the spring for considerably more than you paid for them. And the same is true of cows that are expected to calve in the winter. New milch cows in the winter, or early spring, are always wanted by the regular milkmen. We know men, who for years have made a regular business of buying cows in the fall, and feeding them all winter—selling part to the butchers, and part to the milkmen. They make money and manure, and find cows more profitable than sheep. Those who have had no experience, might do better by trying sheep. Sheep will do better on straw than cows. Good corn-stalks, cut before frost, and properly preserved, are excellent alike for cows and sheep, but they are probably fed to cows with more profit. And this is true of hay. The real profit in either case, especially where manure is wanted, comes from the extra grain, oil-cake, etc., fed in conjunction with coarse fodder. Straw and stalks alone, make poor manure. We gain nothing by passing straw through a sheep or cow. It is straw still. We must feed bran, oil-cake, malt-sprouts, or grain, and clover hay, in addition to the corn-fodder, if we want to fatten the sheep, produce milk, and make rich manure. We need not say that less labor is required to take care of the sheep. If you are in the country where there is little demand for milk, keep sheep; if near city or village, where there are plenty of dogs, keep cows.

A House Costing \$3,500.

S. B. REED, ARCHITECT.

These plans shown in figures 1, 2, 3, and 4, represent a compact and tasteful house. It is modern in style and arrangement, and contains a fair share of modern improvements. Several such dwellings have been built during the past year, in each case giving much satisfaction. We give the following specifications: The height in the clear of the cellar story is six and a half feet; of the first story, ten feet; of the second story, nine feet. The cellar is excavated to the depth of three and a half feet below the level of the grade in front of the site, and the loose earth removed from the grounds. Foundations are of hard brick eight inches thick, all exposed surfaces neatly pointed in the joints, and the whole made level. The area leading to the cellar has twelve inch jambs, and blue stone steps and coping. The chimneys are of hard brick and mortar. The kitchen fire-place has an opening suitable for an elevated No. 8 Range (eight inch jambs), with hearth and lintels of rubbed bluestone, and slate shelf above. All flues are separate and continuous from each story. The tops are laid in cement mortar. Iron chimneys and heating pipes are set where directed. The side walls and ceilings of the two full stories are hard-finished, on two coats of best brown mortar and seasoned lath. The parlor, sitting-room, dining-room, and hall in the first story, have neat and appropriate cornices, and centers in each ceiling. Soffits and cornices, with rule-joint corners, are set and finished across the openings of the bay windows. The frame of the house is of seasoned spruce timber of the following sizes, viz.:

Sills, 4 by 8 inches.
Posts, 4 by 7 inches.
Plates, 4 by 6 inches.
Rafters, 3 by 4 inches.
Studding (D. & W.), 3 by 4
Veranda sills, 3 by 8 in.
plates, 3 by 7 in.

Girder, 4 by 8 inches.
Ties, 4 by 6 inches.
Hips, 3 by 8 inches.
Beams, 3 by 8 inches.
Studding, (Int.), 2 by 4 in.
Veranda beams, 3 by 5 in.
rafters, 3 by 4 in.

Beams, studding, and rafters are placed sixteen inches apart from centers. The angles in all partitions are anchored together at their joinings, to prevent cracks in the plastering. All windows have plank sills, and those above the cellar timber sills. The cellar windows have stone sills, one and a half inch sash, and glazed with second quality French glass. The cellar and attic sashes are hung on butts or pivots—all others to balance weights with best cord. The exterior sides of the frame to the height of the belt course are covered with clear, white pine five-inch clapboards, laid to lap one-fifth of their width; and above the belts of pine, five by eighteen inch shingles showing one-third their length on T. & G. sheathing laid horizontally on sheathing felt. The water tables, belt courses, corner boards and cornices are of white pine as shown by the plans. The verandas and porch have level ceilings of narrow beaded pine. The roofs are covered with eight by sixteen inch "Bangor," Pa., slate on tarred felt and hemlock boards. All valleys,

blind nailed. The first story floors are one and an eighth by four inch T. & G. spruce, blind nailed. Other floors of one and one-eighth by seven inch, T. & G. close laid and double nailed. The attic is floored, but is otherwise unfinished, and serves as a large store room.

The main stairs are built of white pine, with newel's, rails, and balusters of ash. The attic stairs are enclosed with narrow ceiling, with door at the foot and neat hand-rail above. The stairs leading to the cellar are of stout plank, with plain hand-rails along the sides, and door at

The one and a quarter inch doors have rim locks—others mortice, all with brass bolts and keys. The knobs, roses and escutcheons in the first story main parts are imitation bronze; all others of porcelain, with silver-plated shanks and bases. The sliding doors are hung with "Warner's Hangers." Sash fastenings of approved pattern are put to all windows. The lock for the front door has night latch attachments. A gong bell is put in the front hall, with all necessary wires and cranks, leading to a bronze pull in the frame of the front door.

The outside dressed pine work has two coats of paint, composed of pure lead and linseed oil, with stainers to suit the owner. The inside finish is wood filled throughout, with the halls and parlor stained black walnut. A No. 8 Range, with water-back and elevated oven, and an oval top copper thirty gallon "Brooklyn pressure" boiler, with "Lockwood" stand, an iron sixteen by twenty-six inch sink, and a plank wash-tub, with two divisions and lids, are set in the kitchen. A French bath-tub, lined with planished tin fourteen-ounce copper—a "Zane's Sanitary" water-closet, a six gallon tank, and a twelve inch wash-bowl are set in the bath-room. Water supply pipes of one inch galvanized iron, lead from the street main to the rear of the cellar, and a three-quarter continuation pipe leads to the tank, with five-eighth branches for cold water leading to the sinks, tubs, boiler, bath-tub, water-closet, and wash-bowls, etc. A four-inch soil pipe leads from the bottom of the cellar to three feet above the kitchen roof, with all necessary branches for the connection of the waste pipes, and with joints caulked with lead. "Adee" traps of lead are properly connected with four inch pipe leading from the water-closets, and with the two-inch soil pipe, running from the sink, wash-tubs, and wash-bowl, and properly connected with the one and three-quarter inch waste pipes. The traps have screw plugs to each, and all necessary stoppers and chains provided. A stop and waste cock is put in the one inch pipe arranged to exhaust all waters from the distributing pipes. A sediment cock with waste branches connects with the cold three-quarter inch lead pipe, leading to the soil pipe. A drain of four inch vitrified tile is laid below the reach of frost, leading from the lower end of the soil pipe to the street, sewer or cesspool, with joints made

Fig. 1.—FRONT ELEVATION OF HOUSE.

top. All inside casings are of clear seasoned pine, with jambs and reeded architraves, head and foot blocks, all extending to the floor, with panels under each window. A chair back is put around the dining-room and kitchen, two feet nine inches from the floor. The bath-room, bathtub, wash-stand, and water-closet are wainscoted with narrow T. & G. ash. The tops of the bath-tub and water-closet are of black walnut; of the wash-bowl marble, with wall plates complete. The kitchen sink is wainscoted with narrow pine, with door to form a cupboard. Closets are shelved and hooked in the usual manner. Hard wood saddles are put down to all doors, and turned stops behind all such as require them. All doors are

perfectly tight with cement.—Estimate of materials, etc.:

Feeding and Care of Farm Animals.

PRIZE ARTICLE—BY "A WESTERN FARMER."

Swine.

The farmer who lives a long distance from market, or who has the range of a large wood lot, should select one of the larger breeds of swine. The villager who grows his own pork will find the small breeds best suited to his purpose. Berkshire, Poland-China, Essex, Duroc-Jersey, Yorkshire, Suffolk, and other breeds and crosses all have good points. From them any person can select the kind best adapted to his wants. The boar should be a thorough-bred, paying especial regard to its length and depth of body, vigor, health, and strength. The ears indicate fineness, alertness, and vivacity; the eye and mouth intelligence and tractability. Give him room for exercise, good water, and let his food be varied. The sow should be of good shape, strong, healthy, perfectly docile and well grown. Very young sows deteriorate the stock; full grown sows improve it. While growing, vary her food, give her all the grass range possible, to develop body and strength. After being bred to the boar it is best to keep her separate from shoats and fat hogs. Her food should be bulky rather than strong—to satisfy but not to fatten. Slops, bran, oats, roots, and well cured clover hay—cut in blossom, chopped and steamed, or wetted and primed with oat-meal or corn-meal is an excellent bulky food mixture for a sow. Provide plenty of pure water with dry shed and abundance of hedding. Pet and handle her as much as possible. The average period of gestation is one hundred and fifteen days. Ten or twelve days before farrowing, place the sow in a warm, dry pen, about eight by ten feet square, and give but a few handfuls of short straw and forest leaves for a bed. This is an important point. With a large quantity of hedding she will construct a deep nest, and in it more than likely, crush her young pigs to death. With a small quantity she will make a flat nest, and unless foolishly vexed or disturbed, will rarely injure the pigs. Years ago I tried the much lauded plan of fastening a rail around the inside of the pen eight or nine inches above the floor and out from the sides, and giving more bedding. The experiment cost me about fifty dollars worth of pigs crushed and chilled to death. For a month before farrowing, feed little or no grain. Potatoes, chopped mangels, apples, and other cooling, succulent food, should be fed for the purpose of keeping the blood cool and relaxing the system. A sow thus fed will be quiet, and seldom show a disposition to devour her pigs. After farrowing she will eat very little for a day or so. A thin, sloppy mush of skim milk and oat, barley, or corn-meal, and bran is best for her. Gradually increase the solid foods to all she can eat, make her slops nourishing and provide it in plenty. When the pigs are able to look out for themselves, clean out the pen and supply an abundance of short straw and forest leaves for hedding. Open small doors and let the pigs run out to exercise in the sunshine. If there is a poor runt in the litter destroy it. It might make a hog in time, but it rarely pays to keep it. When pigs are about four weeks old, open the doors and let them into a yard. Feed all together, but let each sow and litter retain its own pen for a sleeping apartment. Induce the pigs to eat as early as possible by placing a trough where only they can get to it. Feed them twice a day with thin slops of corn-meal, pea-meal, or wheat middlings and skim milk, or kitchen slops. When the clover will furnish a bite, let the sow and pigs into pasture. Continue to supply all the slops and meal, or soaked corn, they will eat, and also plenty of water. Make a deep trough, fasten a cover on it with hinges, and through one end cut a snout hole. Bank the earth against it even with the top, and keep it full of water. Scrub it out once a week. While suckling the pigs the sow is to be regarded simply as a machine for the production of pork; hence it is advisable to let the pigs run with her until she makes strenuous efforts to wean them, then she should be removed.

While the pigs are being weaned, castrate and

ring them. Use a smooth ring with points meeting outside of the flesh. Place it firmly in the end of the snout, just full, so it will remain but not pinch. As hot weather comes on, provide a dark shed with a dry plank floor, and in it feed green sweet corn. The pigs will rest in it, and eat corn through the heat of the day, and feed on the clover at night. Sweet corn is capital feed for growing pigs, and should be used from the time it begins to ear until frost. The early and late varieties will furnish a succession. As cool weather approaches, gradually increase the supply of solid, strong food, and finally shut off the clover.

Experiments have proved that corn is not the best food for the production of pork when fed alone, but it is employed more extensively than all other grains, roots, and vegetables together. If used as a chief article in combination with other foods it is unequalled by any other cereal or vegetable that can be successfully grown over as great a range of country. Peas, barley, oats, mangels, potatoes and artichokes are undoubtedly valuable to a certain extent, but they can never supersede corn for reasons obvious to every intelligent farmer. We shell corn and soak it in water twenty-four hours to soften it, because some hogs with defective teeth, cannot thoroughly masticate it when hard, and consequently waste a great deal. Soaked corn contains all the fattening qualities of cooked corn, and is as digestible. Soaking costs nothing; cooking is expensive. For soaking corn it is best to use two tanks or tubs. When a cheap power can be obtained it would probably pay to coarsely grind or crack the corn; twelve hours would then be sufficient for soaking. For variety, and to keep the hogs in healthy, thrifty condition, feed potatoes, mangels, peas, artichokes, oat-meal, and bran or middlings mixed to a mush with skim milk or slops; even if only in small quantities they will prove very beneficial. Aim to feed hogs for market profitably. Intelligent observation and experiment will show how it can be done. Remember that warm, dry, well-bedded sheds are absolutely essential to profitable feeding.

Keep your eye on the market and get all the information you can concerning the supply of hogs and pork. Take advantage of a rise and sell. Fine, smooth, even lots of hogs are always in demand, and are certain to bring the top price. Farmers living over a mile from market will find it much the best plan to erect a chute, loading their hogs into wagons and hauling them. In case they are driven, some of their bedding should be taken along in a wagon for use on bridges. Hogs will readily walk over a bridge on their old bedding. After passing over one bridge the bedding can be raked up, loaded into the wagon, and used on the next, and so on.

Sows should be bred for two years, and then fattened and sold. Begin feeding grain about September 1st, while on grass, in full flesh and thrifty condition. About four weeks before they are to be marketed, the pigs should be confined in a small, warm, dry, and well-bedded pen, and fed heavily with soaked corn, or meals mixed with skim milk, slops, etc., and an occasional ration of artichokes or other vegetables. Under such treatment the sows will fatten very rapidly, and prove profitable.

Provided with wholesome food, pure water, and clean, dry, well-littered shed, a hog will never become diseased unless previously infected, and that the farmer must carefully guard against when procuring his change of stock. A healthy hog requires no stimulants, preventives or tonics of any kind. A diseased hog should be completely isolated from all others, or killed and burned. Lice are indications of ill-condition or unclean quarters. Kerosene applied with a swab will destroy the vermin.

The best time to have pigs farrowed is an open question. With plenty of shed room, warm pens and yards, it is much the best plan to have them early in March. Without these conveniences, the middle or latter part of April would be better. Much also depends upon locality. North of thirty-nine degrees there is often considerable very severe weather in March, and the early part of April, while south of that latitude there is but little. Each farmer must take all these facts into consideration,

and decide the question for himself. When a boar's tusks become too long, saw them off before he injures valuable stock. In ringing an old sow, place one ring in the end of the snout, and one between the nostrils, the same as a bull ring. Many prominent feeders hold that all kinds of food should be slightly fermented, as it is more easily digested, and leaves the stomach in better condition. This has been our experience also, but we have learned that some care and skill is required in this mode of preparing food. If it passes the first degree of fermentation and becomes a little too sour it is very injurious. We prefer to feed unfermented food if there is the least danger that it may, from neglect or inexperience, become too sour. Artichokes are useful for breeding sows in the late fall and early spring. They should be planted in a dry, loamy soil, so that they may be readily dug when wanted.

Fastening the Wires of a Trellis.

The tightener is made of a stout piece of well-seasoned oak or cedar, and has a slot sawed for about eighteen inches from the bottom, through which the wire is passed. To prevent splitting, a ferrule is placed on just at the top of the slot. The wire is loosely secured with staples to both the main post *a*, and the straining post *b*, and is passed through the slot in the tightener. A firm grip upon the wire is taken with a pair of stout pincers, as

A WIRE TIGHTENER.

close to the tightener as possible. The upper end of the tightener is pulled down until the wire is taut, when the staple in the straining post is driven down. The wire is cut off at a convenient length, and the end wound around the staple. In late fall we draw the staples in the straining posts, and the following spring adjust the wires again. The engraving, to avoid confusion, shows the lower wire only, passing to the straining post. In use, all the other wires are carried to the post.

Building an Ice-House.

We can best answer numerous inquiries about building an ice-house, by giving a description of one we put up for our own use a few years ago. The locality selected was one affording facilities for drainage, was well shaded by trees, and conveniently near the house. The surface being sandy, was levelled, and four by six inch sills, fourteen feet long, were laid down and halved together at the corners. The plates of the same length, of two by four inch stuff, were put together in the same manner. Studs two by four, and thirteen feet long, were mortised into the sills and spiked to the plates every eighteen inches. The roof, a "square-pitch," is covered with ten-inch boards, two inches apart, and other boards of the same width nailed on as battens. Hemlock hoards, nailed horizontally on both sides of the studs, cover the sides and ends; the four-inch space between the outer and inner siding, being filled with sawdust. There is a door at the ground level, and another just above, both being practically double, by means of horizontal hoards placed on the inside as the house is filled. The roof projects over the sides about a foot, and the spaces between that and the plates are left open to afford ventilation. A layer of sawdust, four inches or more thick, was laid upon the ground, and the blocks of ice stacked upon it as closely as possible. The top of the ice is covered with a layer of marsh hay, about two feet thick. This house, if filled up to the roof, would hold about sixty tons. When half filled, there has been a considerable quantity of ice left over each year, though it has been used very freely. The cost of the house is small.

Farming in Germany.

Germany may well be classed among the great agricultural countries of the earth. More than half of its forty-three million population cultivate the soil. Agriculturally considered, Germany is a magnificent country. The centre and southern portions of the empire are a range of high table lands, interspersed with numerous ranges and groups of mountains, and abounding in the finest timber, growing in a soil rich with the decay of

A WAYSIDE CROSS.

centuries. The northern section is a vast sandy plain, stretching from the Russian frontier on the east to Holland on the west. A portion of these plains is valuable chiefly for grazing and for its deposits of peat, but a good half is fertile under successful cultivation. It is a peculiarity of the physical constitution of Germany, that little of the earth's surface is waste. The very forests, grim and desolate to look upon, serve to fatten the famous pork, the growers of which American competition recently threw in such a flutter.

Although carried out upon an old-fashioned

GLEANING FODDER.

plan, farming in Germany is really superior in its development to that of any other section of the continent of Europe. The sterling industry, intelligence and skill of the Germans as an agricul-

tural people, is shown by the prominent position they occupy among the farmers of the New World. Emigration brings to our shores no class of agriculturists so alive to the possibilities of their profession, and so ready to labor and expend money on its improvements as they. The enormous area of the various European States now comprehended in the German empire, over two hundred and eight thousand square miles, is prolific of nearly all the leading crops known to civilized man. The vegetable products comprise a very large proportion of the European flora. The north is especially rich in the ordinary cereals, all of which are extensively cultivated and exported, chiefly from Württemberg and Bavaria. The latter State enjoys its principal distinction, however, from its hop crop. Chicory is another of its products, which has an European reputation. The chicory grown in Bavaria, and throughout the districts between the rivers Elbe and Weser, supplies the place of coffee to more than half the people of Europe. While the grains grow best in Northern Germany, the central districts are most prolific of hemp and flax, madder, wood, safflower, and similar products, which they export in enormous quantities. The best vine districts are found in the valleys of the Danube, Rhine, Main, Neckar, and Moselle, but the vineyards extend over the country in all directions, as far north as Prussia, and produces wines of excellent qualities. The great plains which border the Empire on the North Sea, are noted for their magnificent breeds of horses. The famously fine wool of Germany is chiefly derived from Saxony, Silesia, and Brandenburg, where sheep flocks are bred to a high degree of perfection. The rich alluvial flats of Mecklenburg and Hanover are celebrated for their cattle, and all the forests of Northern and Central Germany produce a superior and famous breed of swine. South Germany still abounds in various kinds of game.

Standing next to Great Britain in the care and success with which its agricultural possibilities have been cultivated, Germany is in many senses better circumstanced than that country, as far as its agriculturists are concerned. There is far less abject and grinding poverty among the lower order of agricultural laborers, and a more permanent prosperity among the middle-class farmers. Not a little of this is due to the Agricultural Colleges, established by the States, and which, by educating the youth of the country, have made farming as honorable a profession as medicine or the law. Several of the States have also done much to advance agriculture by the periodical agricultural exhibitions, which promote the adoption of the latest improvements in machinery, and extend among the lowest order of peasants a practical knowledge of the advancement of the times.

Many of the great German land-owners cultivate their enormous estates personally, and live lives of an almost patriarchal character, devoted to the improvement of their teeming acres, and of the people who populate and work them. The State also owns vast tracts, which are cultivated by lessees or foremen, as the case may be, and whose agriculture is carried on by an army of laborers, with military strictness and precision. The middle-class farmers in many instances live upon farms which have belonged to their families for centuries. These farmers constitute a sort of rural aristocracy, like that of the country squires in England. As in all the rest of the Old World, however, the farmer's lot in Germany is one of much work and little pleasure. Upon a German farm of the more modest order, every one works—women as well as men, and children as soon as they are able to be made useful. Labor begins with the dawn, and ends with the day. The country is a great garden, bursting with the wealth of its soil products, but it is so because those who populate it are an industrious, skillful, and tireless people, who permit no toil to stand between them and success.

The sectional peculiarities of the rural population of Germany render it impossible to give any description of farm life which shall apply to the whole country. Broken up for centuries into petty States, the people of the Empire still preserve the

costumes, manners and customs which characterized them when they were separate peoples. Traveling from farm to farm, you suddenly find yourself confronted by farmers whose dress, speech, and manner of living, are all distinctly different from those you have just left. You have simply

A LANDED PROPRIETOR.

crossed the border from one of the old States into another. Germany is one great nation now, but it will still be generations before the German people become one homogeneous population like our own. No matter what their differences of habits and living are, however, you never find the German farmer plunged in ignorance. He may be uneducated and rude, but he is a man beneath his rough skin; a man who starves neither himself, his family, nor his brutes, who does not keep his children in ignorance to save a few dollars, and who does not refuse to learn how to improve his farm, or the condition of his family and flocks, because the old way, which was good enough for his father, is good enough for him.

One universal trait of the German farmer is worth especial notice. Nowhere in the world is there to be found a community more moral and sincere in its cultivation of the domestic and personal virtues. Be the district Protestant or Catholic in its faith, its denizens will be found to practice that faith with the fervent and uncompromising

THE FARM BOY.

devotion of true Christians. Honoring his God, and the divine laws, it is no wonder the German farmer has won for himself the reputation for pure manhood, inviolable honor and patriotism he enjoys. Integrity and industry are well rewarded.

FARM LIFE IN GERMANY.

Drawn and Engraved for the American Agriculturist.

Among the Farmers.

New Series.—No. 7.

BY ONE OF THEM.

The markets, the hands we can hire, the crops the land will grow, the insects, and our own knowledge of these and other things, determine the success of our farming operations. There is such a multiplicity of things to be considered, that it is most natural farmers should settle down, and let the farms run themselves in "the good old way." There is probably not a tilled field on the farms of most of the readers of the *American Agriculturist*, on which the established course cannot be followed out. This may be corn, potatoes, oats, or barley, and grass; or corn, roots, wheat, and grass, or some other regular rotation by which the land gets a good manuring once in five to eight years, and top-dressings or manure in the drill more or less between times. Innovations come slowly, and usually take little hold of the people, because farmers are conservative and distrust new things.

The Silo.

The Silo is a wonderful innovation, which has gone steadily on, constantly adding to the numbers of its firm adherents. The use of ensilage is becoming more and more general. I have now no means of estimating the number of tons of corn-fodder ensiled this year, but it must be enormous. Experience has been a good teacher as usual, and the work has been better done, the corn less frosted, and the quality of the ensilage will no doubt be proportionately better. Even if ensilage is really no more nutritious than well cured corn-fodder, the cattle like it so much better that it is a great satisfaction to feed it. They eat it clean; the manure seems to be worth more, at any rate it is much better to handle. The time-honored custom of foddering the cattle on some convenient lot, over which the corn-fodder can be evenly distributed in the feeding, so that the stalks may be plowed in where the cattle stripped them of their leaves, has, I hope, received its death blow.

Sweet Ensilage.

The subject of sweet ensilage was well discussed last winter and spring. I know of a number of silos which have been filled with the view of testing Dr. Miles' theory, and the value of the material. The experiments should be carefully written down, so that the conditions may be known. Then when the silo is opened, the experimenter will have all the facts before him. I have seen silos which were filled slowly when the heat rose quickly to one hundred and twenty-five degrees, and even higher, and in which it seemed to be uniform. The method of testing was very simple. Holes were made in the ensilage with a fork handle, and a common floating (all glass) thermometer was lowered into them by a string. After remaining there a few minutes it was drawn up and inspected. The advantages of sweet ensilage must be kept in mind, notwithstanding that the law of the State of New York, in forbidding the feeding of fermented food of all kinds to milk cows, makes especial exception in favor of "ensilage from silos." A great part of this material as usually preserved is utterly unfit food for cows. Its composition is of the most indefinite and uncertain character. It contains various acids, some comparatively innocent, like lactic acid, others most injurious, as acetic acid (vinegar). Some samples contain a notable quantity of alcohol, which rapidly changes to vinegar on exposure, while in others the fermentation has progressed so far that the ensilage has the odor of decay, or is rotten, and not fit for pigs. The object aimed at in making sweet ensilage, is to start an active fermentation at the very first, when more or less air is present, so that the heat thus raised shall destroy the germs of that slower fermentation which takes place when air is excluded. The degree of heat which may be generated in vegetable substances in the presence of the right quantities of air and moisture is something wonderful. The heat of boiling water is readily attained, and spontaneous

combustion no doubt sometimes occurs from this cause. Hence when a heat sufficient to kill the germs of fermentation has been reached, say one hundred and twenty-five degrees to one hundred and thirty degrees, it is of course policy to check it at once by excluding the air, because fermentation goes on at the expense of the material itself. The only difficulty, which, so far as I can learn, has presented itself, is that of securing a uniform heat throughout the entire mass—in the corners, and along the side, as well as in the middle of the silo.

According to Prof. Miles' experiments, a heat of one hundred and twenty degrees proved uniformly fatal to the germs or ferment plants, so if we find a temperature of one hundred and twenty-five degrees to one hundred and thirty degrees existing in the general mass, we may reasonably expect that one hundred and twenty degrees exists in the corners and against the walls. Those minute organisms which I have called germs of fermentation, and ferment plants are known by sight only to microscopists, and by them are called "Bacteria." There seems to be, so far, an unlimited number of different kinds, and investigators are constantly finding new ones, very much as the astronomers used to "pick up" asteroids—and really a bacterium is about as hard a thing to pick up as an asteroid of the tenth magnitude.

Bacteria.

This bacteria question seems to be getting serious, and if we believe all the microscopists and pathologists tell us, we have now-a-days more to fear from these little plants than we would ever have imagined. The engraving shows the circular field of a microscope in which several specimens of bacteria are seen greatly magnified. It is said that bacteria cause all kinds of true putrefaction and most

BACTERIA—HIGHLY MAGNIFIED.

of those decompositions which are of a kindred character; they regulate decay, are the direct cause of many diseases, and floating in the air they cause epidemics and epizootics. It is supposed that influenza, scarlet fever, cholera, and other "catching" maladies are caused by them, also that contagious ailments among animals come from the same source. Foot and mouth disease, hog cholera, chicken cholera, rous, Texas fever, pleuro-pneumonia, and many other diseases of animals are supposed to be caused by different kinds of bacteria. Consumption in man is of similar origin.

Pleuro-Pneumonia at the West.

The occurrence of pleuro-pneumonia among certain herds of cattle in Illinois, and the wholesome dread of this disease which seems to be universal at the West, leads me to allude to my experience with the disease in 1859 and '60. It will be remembered that at the time of the breaking out of the contagion in Massachusetts, in 1859, the State Legislature appropriated ten thousand dollars (to which private subscription added fifty thousand dollars, making sixty thousand dollars in all), and authorized the slaughter of all infected herds. I was present two days in North Brookfield, when the commissioners were in the midst of their work of slaughter. The animals had all been inspected. All obviously diseased animals were killed without remuneration to the owners, and the other animals in the herd were appraised at a low market

value. The farmers, who had been previously notified, had great pits dug, and the cattle were solemnly driven to them, knocked in the head, their lungs opened and examined, memoranda made, and every hoof buried five feet under ground. Think, for a moment, what sacrifices for the common weal these good people were called upon to make. Are the Illinois farmers equal to the occasion? It takes a man of some nerve to lead out a herd of thirty to fifty head of fine cattle—or if not fine, the best and all he has—to the deep trenches and proceed to bury them. It is no less hard for the good housewife to turn her cheeses, in sorrow, that no more for months can stand by them on the empty shelves, to pour away the last milk, and churn the last batch of cream, and scour the tins for the last time, and set them out to sun. I well remember how a word of sympathy spoken to a good woman in North Brookfield, caused her tears to flow like summer rain. Why it is that this disease has not proved as virulent in this country, as in parts of Europe, and especially in South Africa, I do not know, and it remains still an open question what it will be in any section where it has not been. I have for twenty-five years dreaded the time when it should make its appearance at the West. It seems now that there can be no doubt about it. Dr. Loring, the Commissioner of Agriculture, knows the disease very well, and was, I believe, one of the Commissioners who extirpated the disease in Massachusetts, associated with Dr. Dadd and Hon. Amasa Walker, who were the most active. Do not let us forget that this same disease made its appearance in South Africa, in the Dutch settlements, and quickly spread into the Zulu country, where it absolutely annihilated the cattle interest. An American missionary, Rev. Mr. Lindley, related to me that he was at the time stationed among an isolated agricultural tribe, whose chief wealth consisted of cattle. As the disease approached, he roused his people, and they established an armed cordon around their fertile valley, and absolutely prevented all cattle from entering. Thus for years they kept their herds free from disease, and saw the utter blotting out of the cattle of their neighbors. There is, however, great hope that the disease will not prove so fatal at the West. The spring and summer of 1860 were hot and dry. At the beginning of the season there were isolated herds in which the disease had showed itself, in Connecticut, New Hampshire, Vermont, and New Jersey—at the end of the season it appeared to have been "burnt out." Whether the heat got up to one hundred and fifteen or one hundred and twenty degrees, I do not know, but the cattle that had it died, and no more appear to have taken it. They have experienced quite a drouth at the West, and I have much hope that the disease may be "burnt out" there. The heat of the sun at my place sent the thermometer up to one hundred and forty degrees for several days in September, though it was only eighty-six to ninety degrees in the shade. No doubt such heat seriously interferes with the spread of lung murrain and similar diseases in cattle.

WHOLESALE SLAUGHTER OF BIRDS.—The bad fashion of wearing bird-skins as trimming for bonnets has caused such a slaughter of our feathered protectors that it may soon become a serious matter for farmers and fruit growers. The amazing fecundity of some of the most destructive insects places birds in the list of necessities. No other agency can keep down these swarming devourers of vegetation. One dealer on Long Island is said to handle thirty thousand skins a year, exclusive of many that are so mutilated that they cannot be used. Hundreds of people there do nothing else from early in the spring through the season but kill birds for these middlemen, who supply the taxidermists. A woman is carrying out a contract to furnish a Paris millinery firm with forty thousand or more skins at forty cents each, she paying the bird butchers ten cents each for skins not too much torn. Only old birds furnish snitable skins, and this of course means the cruel death by starvation of multitudes of young ones.

Cheap Shelters for Swine.

The gain from sheltering farm stock in winter is so great that it should never be neglected, and no animals give a larger return for shelter than swine. When exposed to the weather, these animals will huddle closely together, and in their struggles to get to the center of the heap, where it is warmest, some may be severely injured. They will become heated in the heap, and when they get up the cold air strikes their bodies, and producing congestion, induces the fatal diseases so prevalent during the latter part of the winter. There is a great saving in food by sheltering; experiments have shown that in severe winter weather, sheltered hogs will, from the same amount of food, lay on nearly twice as much flesh as those exposed. The hog seems to be the least adapted of all farm animals to endure exposure; it has not the thick skin and coat of the ox, or the warm fleece of the sheep to retain bodily heat and to protect them from the piercing cold.

The farmer who has a few logs or large poles, and straw for a roof, need be at no expense for materials in making a swine shelter. Select a southern or eastern slope, when possible, and if wooded, all the better. Build up with logs or poles a square pen four feet high. Any sized logs or poles may be used, but the best are a foot or fifteen inches in diameter for the four lower ones, using lighter ones (say six inches in diameter) towards the top, where it would be difficult to place logs as heavy as those used in the bottom. The logs must be notched, or else the chinks between them stopped with boughs or slabs, to make the sides tight for two feet from the ground; above this, notch the poles only enough to make them lie solid, and leave the chinks open. The lower logs must be notched enough to keep them from rolling. On the upper sides of the pen, dig a shallow trench a foot or so from it, and bank up earth from this against the logs, to prevent surface water from running in. Lay poles across the top and on these build a roof of straw. In the east or south side saw a doorway three feet wide, nailing boards to the ends of the logs to keep them in place. No door is required. Give no litter; the animals will be warm enough without it. The roof should project a foot beyond the poles all around, to keep the snow from drifting in at the crevices; this can be done by making the poles which support the roof sufficiently long. This pole shelter protects the swine from rain and snow, and the lower part of the walls being solid, from cold winds. Hogs sleeping in a shelter soon contaminate the air; as their bodies and exhalations heat this air, it rises and passes out at the openings in the walls, while the cold outside air enters and gradually settles; this allows the hogs to constantly have pure air, while cold wintry blasts do not strike upon them.

An excellent shelter may be made on a hill-side, sloping towards the south or east by digging down the bank perpendicularly to form a wall four feet high, making the floor level. Ten or twelve feet from this wall set a row of forked posts, upon which lay a pole for the roof to rest upon. Upon this pole smaller ones or rails may be laid, and upon them a straw roof is built, or a board roof may be laid from the wall to the pole. In this case it is best to have a pole in the middle also. If there is to be a straw roof, the pole in the forks and the top of the wall must be on a level, but for a board roof the pole must be six inches lower than the top of the wall. Dig a shallow ditch along the upper side. The lower side is left open. The two sides will be partly open, and are closed by driving down stakes and banking straw against them, which is to be covered with earth. Leave an opening along the top for ventilation. This is as good a swine shelter as can be made, and requires little labor and material, as the walls are of earth.

Another good shelter is made by setting on three sides (north, west, and south, or east) a row of stout stakes four feet high, the corner ones being forked. Against these pile straight brush with the leaves on if possible, and cover this with earth. Place poles in the forks of the corner stakes, and on these make a roof of boards or straw, as directed

for the other shelters. The bank of brush and earth should not reach quite to the roof, but leave openings for ventilation. If desired, a portion of the open side of these shelters can be closed in the same way that the other sides are closed.

Preparing Hay for Fuel.

R. G. NEWTON, DAKOTA.

As a fuel for the prairie pioneer, hay is the most easily obtained, but its consumption in a common stove is accompanied with several disadvantages. It burns out quickly, makes a litter in the cabin, leaves abundance of ashes, and fills the pipe full of soot. The first two disadvantages can be overcome by having the hay in a compact form. This is usually accomplished by twisting it up in bunches. To do this easily, the hay should be moistened with water, and thrown together in a heap. Pull a

Fig. 1.—PULLING OUT THE HAY.

small handful partly out, and twist it with both hands as shown in figure 1, thus making a rope of any desired size or length—about two inches in diameter and four feet long is the most convenient. Double up the rope or strand as in figure 2; twist the three strands together and push the ends through the loops as shown in figure 3.

A better method, requiring two persons, is with a tool shown in figure 4. Take a piece of half inch round iron about three feet long, bend one end to form a handle, drawing the other down to a point for a hook. Before turning the hook, slip on a round block of hard wood and then a large washer.

Set a two by six-inch scantling in an upright position, either by fastening the upper end to joists overhead in a barn or shed, or by placing the bottom

Fig. 2.—A STRAND.

thirty inches deep in earth. Bevel the ends of a piece of the same scantling a foot long, and bolt it on the upright so that the centre of it will come about three feet and a half from the floor. Bore a hole through the two pieces with a half inch auger, as shown in figure 5. Place the handle in this hole as shown in figure 6, smearing it with some tallow or wagon grease. One person turns the crank and the other handles the hay. Take up a small armful of the moistened or green hay, hook a lock of it on the iron, and when the handle is being turned step back, allowing the hay to be drawn out by the twisting. When the rope is long enough catch hold of the end and twist it as hard as desired, then double and twist it as in figures 2 and 3. This gives a firm roll of hay; the harder it is twisted the longer it will burn.

By means of this device, one can make hay ropes of any length, of two or three strands, which can be used to throw over the hay stacks, fastening stones at each end, to prevent the tops of the stacks from being blown off. The handle, figure 4, can be made from an old wringer or similar machine if at hand.

With a wooden handle on the crank it will turn more easily, and it will not blister the hands.

The dryer the hay is before it is burned, the less soot it will form in the pipe. The Mennonites build their houses with four rooms, and a large brick

Fig. 3.—A TWIST.

arch in the centre (fig. 7), so that it will heat all the rooms. The walls of the arch are thick, and will hold heat for a long time. The arch requires filling only two or three times a day, and may be so constructed that the cooking is done on it at the same time. By having the arch open into one room, it prevents the litter from getting

Fig. 4.—TWISTING IRON.

into the other parts of the house, while in the next room can be set a sheet iron casing or box in which to place dishes or utensils for cooking. If this iron box is well made and has a door fitted in, it can be made use of as an oven for baking.

Watch the Flues.

Nine-tenths of the destructive fires are the result of carelessness. It is difficult to understand why any careful farmer's buildings should burn unless set on fire by lightning. On the farm there are no fires for manufacturing purposes; fire cannot be communicated from one's neighbors; that class which furnishes incendiaries is lacking; and all household fires can be kept under the eye of the farmer and his family. The newspaper reports of the burning of farm buildings show that the fires can nearly always be traced to negligence, and in more than half the cases to faulty flues. The season is now at hand when all the occupied rooms will be heated, and the danger from defective flues is consequently great. Let there be no delay in examining all flues to make sure that they are perfectly safe. If any are found defective, repair them at once. The most dangerous place in a flue is the point where the pipe enters it. If the flue is not built from the floor up (a common way of construction once), this point is in the garret, and

Fig. 5.

Fig. 6.

rarely noticed. Unless the pipe fits the opening very closely, sparks will escape, and falling upon the adjacent wood-work, made dry and combustible by the heat from the pipe and flue, will occasion a conflagration. At least twice every year the joints about where the pipe enters the flue, should be plastered, pressing the mortar firmly against the flue and into the crevice between it and the pipe. Winds, etc., so jar the house, that in the course of months the pipe will work out of the opening, unless well held in place by wires; a point which must be attended to. The mortar between the bricks of the flue may crumble and leave openings. Close these with fresh mortar. Make the flues safe, and keep them so. Inspect frequently. It is not generally known that wood exposed for a long time to a moderate heat, becomes very dry and inflammable, and will take fire with astonishing readiness. Look well to all points where flues and pipes are very close to wood of any kind. Even if there is a space of several inches between the wood and the pipe or flue, protect the wood by covering it with tin. Old fruit cans, by melting the solder and flattening the tin, will answer for this use. Carefully watch the flues.

Fig. 7.

A Superior Shorthorn.

The accompanying engraving is a striking portrait of "Ringlet Fifth," one of the finest Shorthorn cows in England. It is difficult to conceive of much better beef animals than some individuals of this breed. They grow with astonishing rapidity, may be made ripe-fat at two and a half to three years old, at which time they have nearly their full size. They fatten evenly, and the beef is marbled admirably in many families—that is, it shows the "streak of fat and streak of lean," so much admired by butchers, and sought after by buyers, because it makes the meat so juicy and rich when cooked. The Shorthorns are the favorite stock of the West and of the Plains, and well they may be, for their grades of the first and second cross look almost like thoroughbreds, and with the hardiness of the native cows, they combine the quick growth and rapid fattening of the Shorthorn. When the Western farmers want milk instead of beef, he will really have little trouble to breed it, for the Shorthorn is as naturally a milk as a beef-producer, and all that is necessary is to encourage lactation from the first. Recent investigations collated by Mr. E. S. Tisdale, and read before a Dairy Conference at Gloucester, England, indicate very clearly that as bred for milk-producers, the Shorthorns are superior to all other breeds. He gives the following figures as to yield: Shorthorns average seven hundred gallons a year, Dutch (Holsteins) average six hundred and fifty, Guernseys four hundred and sixty, Jerseys five hundred and twenty. While as to quality the order is changed, thus the milk of the Guernseys averaged 14.09 per cent of solids, of which 4.80 was butter-fat; that of the Jerseys 13.6 per cent, of which 4.26 was fat; that of Shorthorns averaged 12.7 per cent, with 3.79 fat; while the Dutch showed an average of only 11.8 per cent, with only 2.97 per cent of fat in the tested milk.

A Clod Crusher and Smoother.

Among the home-made implements in use among the readers of the *American Agriculturist*, the clod crusher here represented seems likely to do good work. Its construction is simple; two-inch oak

A CLOD CRUSHER.

planks are pinned together with tree-nails, or spiked, the forward ends resting upon a broad plank of the same thickness, and a narrower one being spiked, or pinned upon the rear ends. The rear cross plank serves as a cleat or rave for holding stones or logs, to give additional weight. Harrow teeth, also of oak, or other equally hard and tough wood, are set in front. They are a foot long and six inches apart, with a slight backward slope, so as to move nearly upright. The implement may be

drawn with one or two horses, according to the weight placed upon it, and the work to be done. The teeth may also be made longer or shorter, according to the ground. On weedy land it rakes off the weeds, which may be dumped by lifting up the rear end by a ring, or by a short rope attached to it. To secure this raking action, the implement must be drawn square, but if it be desired that it should clear itself of weeds, etc., it must be drawn obliquely, by attaching the horses ucarer to one end of the draft chain. The dimensions are as fol-

lows: planks, four or five feet long; front cleat, eight feet long and ten inches wide; rear cleat, four inches wide; teeth, two inches through for ordinary use, and set six inches between centres. For very rough ground with stones and hard clods, roots, etc., the teeth should be stronger, say two and a half inches through, and eight inches between centres. The other parts to remain the same.

Is your Poultry House ready for Winter?

Cleanliness in all the details of the management of poultry is absolutely necessary to success. Unless there be perfect cleanliness, the fowls will not only be constantly infested and worried by vermin, but they will be liable to many troublesome and dangerous diseases which check growth, development and productiveness in the birds, and even cause death. This should prove, even to the most thoughtless person, that it does not pay to neglect the poultry in the matter of cleanliness.

Now is the best time to make a thorough cleansing of the house, if it has not been done before. If the roosts and the nesting boxes are movable, as they should be, the work is much easier, and can be done much more thoroughly. Take everything from the house that is movable; burn the old nests to destroy the lice and mites, and then, with a broom, sweep down the ceiling and sides or walls; clean the floor thoroughly, and remove the droppings and other accumulations. Get ready some good stone lime, making a moderately thick white-wash. With a good brush go over the entire inside of the house, working the wash into the cracks and crevices. When the first coat is dry, if it is not heavy enough, go over a second time, and when this is dry—not before, let the birds occupy the house. Scrub off the roosting poles, and when dry, smear them well with kerosene. Whitewash the nesting boxes inside and out, make new nests of fresh, well broken straw, and give them a good dusting of Flowers of Sulphur, and place tobacco stems in the bottom of the boxes before making the nests. Scatter sand and air slacked lime liberally over the floors, and repeat the operation as often as necessary to insure pure air and cleanliness.

Which are the Best Fowls?

Which are the best fowls depends entirely upon circumstances; and what may be best for one man, may not be for another. Some raise the birds for pleasure and others mainly for profit, and of the latter class some wish eggs principally, while others desire the heavy weights. As there are now breeds which will meet nearly all requirements, one can make a selection to suit his wishes. It remains principally with himself, whether the flock proves profitable or not, as there is always as much in the food and care as there is in the breed. Where ornament and pleasure are mainly the object, we can recommend the White Crested Black Polish, which are handsome, attractive, and good. While they are largely bred and sold for ornamental purposes, they can readily be made to pay their way, at least some breeders claim that they pay them better than any other breed as egg-producers. They are not large-bodied fowls, but they lay good sized eggs and plenty of them. They are generally hardy and active, while their heavy crests prevent them from flying high, and they can readily be kept within bounds. For eggs principally, the White as

well as the Brown Leghorns deservedly stand at the head of the list. We have invariably had good results from them, and under proper management others are sure to have the same good results. The great reason for so much disappointment with fowls as egg-producers, is not with the breed or the hens, but with their owner, who expects them to produce eggs at all seasons without giving them especial good care, attention and food. They must not only be fed liberally, and at regular intervals, but be protected during cold weather. In some localities it is desirable to have the building heated moderately, if a large one, and the winter is unusually severe. In most cases this is not necessary, as a well made house will generally afford sufficient warmth and protection. D. Z. EVANS, JR.

A Wagon Jack.

Mr. J. R. L. Dean, Greene Co., Ohio, considers his wagon jack, shown in the engraving, superior to any previously described in the *American Agri-*

A WAGON JACK.

culturist. The hoisting movement is a toggle joint. There are two upright pieces of the desired height, firmly bolted to the base. The toggle joint is three and one-half inches wide, and snugly fits between the uprights. An iron hook is fastened to the joint for adjusting the jack to different heights. A pin through the uprights keeps the joint in position. An iron brace supports the handle. This jack is not as easily made as are some others, but the extra work of construction will be amply repaid.

A New Race of Pears.—The Oriental.

The Chinese Sand Pear, *Pyrus Sinensis*, a species quite distinct from the common pear, was introduced into England from China early in the present century. In due time it found its way to this country, being more or less planted as an ornamental tree, and specimens are still to be seen upon old places. It grows to the height of twenty feet or more, and is vigorous and healthy. The leaves are large and shining, the flowers white, tinted with pink, followed by a somewhat apple-shaped, warty, russeted fruit, of no value except for cooking. About half a century ago, Maj. LeConte, a noted naturalist, bought a Chinese Sand Pear and sent it to his niece in Liberty Co., Ga. This tree grew to a large size, bore abundantly, but its fruit was unlike that of the Sand Pear, and of sufficiently good quality to attract the attention of nursery-

and the possibility of establishing a useful race of pears, to which the name "Oriental" has been given by Southern nurserymen. It is a strong point in favor of these pears that, though the LeConte and Kieffer have been planted extensively, North as well as South, not an instance has been reported in which the trees were attacked by blight or other disease. Experience with the common varieties has been very different, and in some cases most disastrous. The Orientals grow vigorously, bear early, and are abundantly fruitful. The engravings, from specimens of average size, show the relative shape and size of the varieties. The LeConte has a waxen yellow skin, with a crimson cheek in the sun. It is ripe in New Jersey the middle of August. Its quality is compared to that of the Vicar of Winkfield and the Duchess. The Kieffer is of rich yellow color, with a bright red cheek, and a very showy fruit. It ripens about a

involucre, instead of being sufficiently ample to completely cover the young nuts, is reduced to a mere plate, only large enough to allow them a place to stand upon. The tree has a diameter of two feet at the base, and annually bears its crop of nuts exposed in this peculiar manner. We have asked Mr. Bagley to send us some of the ripe nuts; these not being confined by the bur, should be much larger and rounder than ordinary chestnuts.

Clear up the Forest Rubbish.

Forest fires are thought by those well qualified for judging, to be fully as destructive to our diminishing store of timber as the axe and saw. The forthcoming volume of Special Forest Statistics by the Census Bureau, will contain a large number of valuable maps. Among these is one showing by colors the percentage of destruction by these fires

THE LECONTE PEAR.

THE KIEFFER PEAR.

Drawn and Engraved for the American Agriculturist.

men and orchardists as a market fruit. The tree was found to grow with tolerable certainty from cuttings, and quite a number were propagated in this manner in Thomas Co., Ga. The variety was named LeConte, in honor of the officer who was instrumental in introducing the tree. It is supposed that the tree which Maj. L. sent to Georgia was either a seedling of the Sand Pear, or an instance of bud variation or sporting. There was shown at the Centennial Exhibition a very showy fruit from the farm of Peter Kieffer, near Philadelphia. The tree producing it was a seedling of the Chinese Sand Pear, but the fruit was so much superior to that of the original tree, that it was supposed to be the result of hybridizing that pear with some of the varieties of the common pear, and the fruit was named Kieffer's Hybrid. Other seedlings of the Sand Pear show that it has a marked tendency to vary from the seed, and that it is not necessary to suppose that the Kieffer was the result of hybridizing. While the other seedlings are inferior to the LeConte and Kieffer, some of them have received names, such as Garber's, Conklin's, and Smith's Hybrids—though probably not hybrids—and have been propagated to a small extent. They are chiefly of interest as showing the tendency of the Sand Pear to vary from the seed,

month later than the LeConte. As to quality, we have had specimens which we preferred to the Bartlett. Neither of these varieties can take a high rank as to quality, but if one has a tree, he is quite sure to have fruit. For cooking, canning, and drying or evaporating, they are valuable. If these varieties are worked upon quince or common pear stocks, they become diseased, and trees propagated from buds or grafts taken from trees on these stocks, are not to be relied upon. Those intending to plant these varieties, should insist upon having trees uncontaminated by any "blood" of the common pear or the quince. The Southern journals show that the LeConte pear has created a furore, and the acres that have been planted are numbered by hundreds. We are glad to see this indication of enterprise, and hope that those who have engaged in it have not overestimated the demand. Improvement should be the next step, by raising seedlings from the best of the Orientals.

BURLESS CHESTNUTS.—H. Bagley, of Greene Co., N. Y., sends us specimens of a peculiar chestnut. The young nuts, instead of being inclosed, as usual, in a prickly involucre which ripens into the bur, are quite naked and exposed. The

in the wooded portion of the United States in a single specimen year—1882. It presents a striking and suggestive picture, especially when we remember that, in the judgment of experts, the greater number of these fires are needless. The most frequent causes are carelessness in burning brush in neighboring clearings, in leaving camp-fires without thoroughly extinguishing them, which means something more than just kicking the brands apart, in running locomotives that have no spark arresters, in neglecting to burn off grass, etc., from the space occupied by the roadway of the railroads at a time of year when it is safe to do so, and last and chief of all, in leaving the rubbish of lumbering—tops, limbs, etc., where it helps start and maintain fires. Some authorities contend that all who own timber land should be compelled by law to collect and burn all such debris, and to remove fallen limbs and dead trees from woods in which no lumbering is going on, in case they join woods owned by other parties. When we reflect that the damage done by these fires is probably not less than three hundred millions of dollars a year, and that it consumes that product, which of all others, is hardest to replace, and yet is indispensable to the national welfare, we see how important it is that all practicable safeguards should be faithfully used. J.W.P.

A Fish-Destroying Plant.

Some items having appeared in the daily papers describing in an indefinite way a plant that destroyed the young in the Government fish ponds at Washington, we made inquiry of the U. S. Fish Commission as to the facts in the case. The editor

PORTION OF BLADDERWORT AND MAGNIFIED PARTS.

of the "Fish Commission Bulletin," Mr. C. W. Smiley, promptly replied, referring us to notes on the subject, and soon after forwarded us a copy of an engraving prepared for the "Bulletin." The plant in question is the Common Bladderwort, *Utricularia vulgaris*, an aquatic plant, common in England, and in a modified form in this country. Besides this species there are some half a dozen others, so closely resembling it in manner of growth that a description of one will answer for all the others. The Bladderworts are mostly floating plants and nearly rootless. Their leaves are submerged and very much divided. An erect stem, six inches or more high, bears several yellow or purple flowers, which are two-lipped with a spur, and resemble those of a Snapdragon. The leaves are furnished with numerous small bladders, which were formerly supposed to be for the sole purpose of floating the plant while in flower, but which are now known to have other uses. The engraving shows a plant of the Common Bladderwort, reduced in size. The flower-stalk in the real plant is from six to twelve inches high; the immersed stems, from one to three feet long, are covered with finely divided leaves, bearing numerous bladders. These give the genus its name, which is from *utriculus*, the Latin for a little bladder. The observations of Mrs. Mary Treat, of New Jersey, as quoted by Darwin, and others, show that these bladders, instead of serving as floats, are generally filled with water and provide the plant with food by trapping vast numbers of animalcules, small larvæ, worms, etc. One of these bladders, magnified, is shown at the left hand of the engraving (3). Without giving a minute description, we may say, that these bladders are about one-tenth of an inch in diameter, and are most admirably contrived for entrapping small animals. The opening of the bladder usually pointing downward, is guarded by an elastic valve so arranged, that its edge yields to the pressure of small creatures from without and admits them, but it only opens inwards, and an animal once caught can not escape. Projecting from the orifice are long, slender, branched hairs, called "antennæ," which serve to attract the small

animals and guide them to the entrance to the bladder. Those who wish to know more of the structure of these bladders are referred to Darwin's "Insectivorous Plants," where they will find the evidence that the creatures caught in the bladders decay, and afford nourishment to the plant. The past summer, Mr. G. E. Simms, Jr., of England, was hatching perch and roach from the spawn in an aquarium. Discovering that many of the young fry were dead, he investigated the cause. Upon lifting a young fish, he found that its head was fast in a bladder of the Bladderwort; other fishes were held by the tail, and in some cases the head and the tail of a fish were caught by two distinct bladders. A bladder, holding a young fish by the tail, is given on the right hand side of the engraving (4). Professor Moseley, Oxford University, examined the specimens and confirmed Mr. Simms in his view of the cause of the death of the young fry. Professor Moseley communicated the facts and specimens of entrapped fry to the U. S. Fish Commission, and the matter is under investigation by Mr. Smiley. It is important to know what kinds of fry are liable to loss from this cause, and also whether all of our species of *Utricularia* are equally dangerous. Hatching ponds may be easily kept free of the plant, as it floats and may be raked out. The case is interesting, as showing that every scientific fact, however insignificant it appears when first established, may have a very important practical bearing.

Watering Plants.

Probably the most important matter to be observed in growing house-plants is that of watering them. The cultivator should know just when to water, and to give it where it will do the most good. Amateur florists often exhibit much poor judgment in watering. It is the habit of some to keep the soil about their plants constantly soaked with water, and they wonder why they are not thrifty or healthy. These cultivators do not stop to consider that such treatment is unnatural, and will have an effect contrary to what is desired. There are those who resort to the opposite extreme, and keep their plants all the time in a perishing condition of dryness, which is even worse than if they were watered to death. If we will observe how judiciously Nature distributes the sunshine and shadow, the periodical rains, and the refreshing dews, we will learn an important lesson. Animal nature is very much like the vegetable in this respect. A pot, or other receptacle in which plants are grown, should be porous; glazed, or painted pots, ought never to be used where plain, unglazed pots can be obtained; all non-porous pots of tin and similar material, should be discarded. Plants growing in them can never compare in health with those that have the advantage of plain porous pots. There should be a hole of sufficient size in the bottom of each pot, to allow the water to drain off, and to pass away as soon as possible. Placing a few pieces of broken crocks, or charcoal, in the bottom of the pots will facilitate a rapid drainage, as good drainage is essential to the growth of strong and healthy plants. When plants require water, it will be indicated by a light, dry appearance of the top of the soil, and if watered when in this

condition, it will do the most good. Give water only when in this condition, and then copiously, giving them all they will soak up at the time, then withhold water until the same indication of their want of it again appears, and apply it freely. Unless plants are in a very dry atmosphere, as in a warm parlor in winter, they will seldom require watering. In summer they should be closely watched, and if exposed to wind and sun, they will require daily watering, to keep them in a flourishing state. When plants are suffering from drouth, the leaves will droop, frequently turn yellow, and drop off prematurely; this can be avoided by timely attention to the growing plants each day.

In summer, watering in the cool of the evening will be followed by the best results, for it will give the plants time to take up and assimilate the moisture necessary to their life, and being completely charged with water, they will be prepared for the hot sun and drying winds of the next day. J. S.

Another New Raspberry—The "Rancocas."

Like nearly all other valuable raspberries, the Rancocas is a chance seedling. Mr. Albert Hansell, of the town of Rancocas, N. J., discovered in a most unfavorable locality, a bush which appeared to present so many good qualities, he was induced to try the effect of giving it a better chance. As the result the plant was propagated as rapidly as possible, and several acres were set with it to supply fruit for market; thus the variety has been tested on a large scale. This fall the plants are placed on the market by the Chase Nurseries, who claim for it an earliness equal to that of any other variety. According to Mr. Hansell, he commenced picking the Rancocas this year on June 21st, having made his last picking of Sharpless strawberries on June 19th. Other claims are: It is as hardy as the hardest, yields as well as the most productive, and in size is equal to the largest good market berry, being uniformly larger than the Bradley-wine. The engraving gives the size and shape of the fruit. The principal point in a market berry is its firmness, to allow it to be shipped. "As a shipper, it is perfect." This is a strong claim to make, but it is supported by the statement that "the fruit has been shipped in quantity from

THE RANCOCAS RASPBERRY.

Philadelphia to Boston, arriving there in perfect condition." Mr. Hansell states that in his plantation for market, he does not use stakes or trel-

lises, but after heading the fruiting canes back to two and a half feet from the ground, he ties "three or four of them together at the top, so as to make a good arch, which renders them self-supporting." The sum of the desirable qualities possessed by the Raneocas red raspberry is expressed thus: "The busy man's berry. The lazy man's berry."

What is Sphagnum?

The suggestion last month of a new use for sphagnum—that of bedding for animals, has brought out the inquiry—what is sphagnum? Sphagnum is the name given by the ancients to

SPHAGNUM, OR PEAT MOSS.

the peat mosses, and is used by botanists of the present day to distinguish these from other mosses. There are in the United States more than a dozen species of sphagnum, but practically, in considering their uses, we may regard them as one. The engraving of one of the common species will give an idea of the appearance of these plants. They have numerous short branches, thickly covered with minute leaves, which are beautiful objects to

examine with the compound microscope. These mosses grow in wet places, and in such numbers as to cover large tracts, and form peat bogs. In these the mosses grow in close contact, the tops of the individual plants only being visible. The surface of the bog is of a pale yellowish green. As the moss grows, the plants increase in height, while their lower portions gradually decay and form peat. The moss when taken from the bog is saturated with water, and is allowed to drain and dry before it is baled for transportation. Even when moist and exposed to the air, the moss does not readily decay, or even become sour, and it retains its elasticity in a remarkable manner. It is unequalled as a material for surrounding the roots of trees, and plants in general, and is much employed by nurserymen and florists in packing their stock for transportation. Gardeners make use of sphagnum as a medium in which to grow some kinds of orchids and other plants which are natives of bogs. They also use it to mulch the surface of the soil in pots, and when dried, rubbed up and sifted, it is a most excellent material for covering fine seeds. For these and other uses, sphagnum is in demand, and as those who live at a distance from localities producing it, are obliged to purchase it, there is already considerable traffic in the article. Its use as a bedding material is likely to rapidly increase.

GIVE THE PUMPKIN A CHANCE.—The pumpkin is an outcast, crowds itself through the world, and gets along as best it may. We object to its being so despicably treated. For dairy cows the pumpkin is highly valuable, and in no way objectionable. It is rich in fat and sugar, tending to increase the yield, while its yellow color adds to the appearance of the butter. A well-known authority claims, that a ton of pumpkins is more preferable for dairy cows than two tons of rutabagas, and several times as many white turnips. The hard shell varieties can be kept well on into the winter, if stored in a dry place with hay or straw packing. There are worse things for farmers to have in a field than sixty-pound pumpkins.

The Relation of Plants to Health.

JAMES SHEEHAN.

Plants at present are more generally cultivated in-doors than formerly, and they may be seen in almost every home. The cultivation of plants in dwellings is decidedly a modern custom—at least to the extent to which it is now practised. One who now contemplates building a dwelling house, plans to have included with the other conveniences of a first-class home, a suitable window for house plants. As the cultivation of plants in dwelling houses increases, the question is raised by some: "Are not plants injurious to health, if growing in the apartments in which we live and sleep?" We know of persons who would not sleep in a room in which a number of plants were growing, giving as the reason that the amount of carbonic acid gas given off by the plants, is detrimental to health. Now this view is either true or is not true. We have made a particular study of this matter, and speak from experience. Over ten years of my life has been spent in the greenhouse, among all kinds of plants; I have frequently slept all night among them, and never observed it to be in the least detrimental to my health, but, on the contrary, I have never felt better than when among plants. Gardeners, as a class, those who have spent their lives among plants, show, so far as we have observed, a longevity equal to, if not exceeding that of any other class who are engaged in any of the vocations usually regarded as healthful. We must admit, however, that we have never known of a case of chronic rheumatism to be benefited in the least by working in hot-houses, on account of the perpetual dampness of the air. On the other hand, we know of a number of persons afflicted with various other diseases, who have been noticeably benefited by working among plants, perhaps it was owing to the health-giving bodily exercise required by the work, rather than the supposed health-giving effects of the plants themselves; we think the result was due to both. An eminent physician cites a case in which his sister, aged fifty years, was afflicted with tubercular consumption, her death, as the natural result of such a terrible disease being expected at any time, but being an ardent lover of plants and flowers, she was daily accustomed to move among her plants, of which she possessed a large number, in her sleeping room as well as many other specimens in beds outside. Her friends reproved her for sleeping in the same room with her plants; but the years came and went, and she was still found moving among her flowers in her eightieth year, surviving those, who many years before predicted her immediate demise, as the result of her imprudence. Who will say but what the exhalation from her numerous plants increasing the humidity of the atmosphere in which she lived, prolonged her life? The above is but one of many cases, in which tubercular consumption has been arrested and sometimes wholly cured by the sanitary effects produced by working among plants for a considerable time. We know of cases in which druggists, ministers, and students from school, were compelled to relinquish their chosen vocations on account of failing health, resorted to the nursery or hot-house. In almost every instance restoration to vigorous health was the result. We contend, therefore, that this old superstition that house plants are injurious to health, is nothing but a myth. The amount of carbonic acid gas at night discharged from two dozen large plants, will not equal that exhaled by one infant sleeper, as has been demonstrated by scientific men. Because a few old errors stick to the absurdity that "plants are awful sickening things," it is no reason why sensible people should be at all alarmed by it. [The more recent discovery that plants in flower produce ozone, a form of oxygen noted for its

activity in purifying the air, and destroying the various disease germs, is an additional reason why plants should not be excluded from the sleeping rooms and other parts of our dwellings. — ED.]

What shall be done with the Front Yard?

Every one who has just completed a new house, finds himself confronted with the question of the best arrangement of the front yard. The same question should present itself to those who have long had front yards and have allowed them to fall into neglect. If one has grounds of several acres to improve, he naturally calls in the services of a landscape architect, but where there are but a few rods, the area is often left to an ignorant jobbing gardener, whose chief idea of improvement is to make crooked walks where straight ones would be in better taste. Rather than trust his front yard in such hands, the owner had better undertake the task himself. In most localities it will be too late to execute the work properly this fall, but the plan

Fig. 1.

Fig. 2.

may be decided upon, and all the grading and shaping may be done in readiness for planting next spring. With a small area there is great danger of undertaking to do too much; this should be avoided, and simplicity and neatness be aimed at. The accompanying plans, by Elias A. Long, will suggest the manner in which the planting of a small area may be varied. These are intended for the smallest village and town front yards, but the same designs may be adapted to much larger areas. In all of these, the house is reached by a walk running straight from the street along the boundary. Great care is needed in selecting materials for planting small areas. A tall-growing tree would be out of place in such a yard, while shrubs of low growth, and dwarf evergreens, are well suited to such grounds. The chief point should be to secure as much grass as possible. In figures 1 and 2, small shrubs and flowers are employed, and in figure 1 a special ornamental bed is provided for; this will be more satisfactory if planted with coleus and other "follage plants," than with flowers. In

Fig. 3.

Fig. 4.

the design, figure 3, the marginal border may be planted with perennial flower roots, making such a selection as will afford a continuous bloom all the season. Three choice shrubs occupy the border in the centre. Figure 4, having more grass, will appear larger than figure 3. The marginal border here may be planted with perennials also. The border surrounding the bay window should hold climbers for the window, and low-flowering shrubs. The beds, out in the lawn, may have each a dwarf evergreen; if the surface of these beds be planted with Ivy, the effect will be very fine. The surface between the beds in all the plans may be of grass, or gravel; the former is preferable. Even in very small lots a good effect is secured by making the beds farthest from the walks with a slightly elevated surface; a rise from front to rear of from six to twelve inches in the highest part will be sufficient.

Closet Door with Shelves for Toilet Articles.

In small bed-rooms space may be economized by dispensing with some of the usual pieces of furniture. If the room has a closet opening out of it, we may do without the washstand, and fit up the closet door with shelves for holding the toilet articles as shown in the engraving. A shelf wide enough to hold wash-bowl and pitcher, soap-dish, and a few hottles, is fastened by small iron brackets to the door, at the height of an ordinary washstand. Below this is a second shelf for holding the slop-jar. The shelves are made of inch boards, rounded at the corners, and painted to match the door. Places for holding bowl, pitcher, soap-dish, and a bottle are cut in the upper shelf, and one only is cut in the lower shelf. These are sawed

INSIDE OF CLOSET DOOR.

out as they formerly were in the old-fashioned wash-stands. It is necessary to have the shelves firmly fastened; otherwise the bowl, pitcher, etc., would be likely to slide off when the door was opened and closed. Above the upper shelf is a towel-rack made by slipping the ends of a heavy wire through screw rings in the door, and bending it in to the proper shape. At one side of the shelf may be a small rack for brushes, and below it a pocket for the sponge. Beneath the lower shelf is a shoe rack, which may be made of boards or of heavy ticking. If the closet door is not a very strong one, or not well hung, bowl, pitcher, and slop-jar, made of papier maché, may be used instead of China. They are very light, and will last a long time. They come in pretty patterns and look quite neat.

Can't You Sleep?

Many persons find themselves troubled by wakefulness. Some resort to the Hydrate of Chloral and other drugs to produce sleep. Such drugs, if their use is once begun, have to be continued, and in increasing doses, and every effort should be made to induce sleep in some other way. Among the methods that have been suggested, is the stopping of all study or serious reading, half an hour before bed-time, and to take sufficient exercise with dumb-bells or Indian clubs to produce a warm glow of the body, and then jump into bed. In winter sleep in a flannel night-gown, and

between blankets instead of cold sheets. The attempt, when in bed, to read some amusing novel may be made, in order to divert the mind from the wakefulness. A second method is, instead of reading, to repeat a poem with which one is familiar. Another plan is, to draw in a long, slow breath by the mouth, and force the breath out through the nose, imagining that the two currents can be distinctly seen. The mind is to be kept fixed upon the operation of breathing, and the endeavor to see the currents as they are expelled. One of our editorial associates finds relief by wetting a cloth with cold water and placing this across the forehead, and binding it in place by means of a towel. It is worth while to give either of these methods a thorough trial rather than to resort to drugs of any kind.

Autumn Styles.

"Partial culture seeks the ornate, perfect culture, extreme simplicity." If this be true, we may congratulate ourselves that we are making rapid advances toward refined and cultivated taste in dress. It has been noticeable in the various fashionable resorts the past season, that the toilets of ladies of all ages have been marked by extreme simplicity. Cambrics, gingham, satines, and the infinite varieties of white fabrics, have, as a rule, been plainly made, often with a gathered, belted waist, and tucked skirt. These are worn through the morning, and in the afternoon changed for a fresh dress of the same material, or perhaps a light wool of some pretty shade. With them are worn ribbons of some contrasting color, which will harmonize with the dress. Not broad sashes, but ribbons two or three inches wide tied around the waist, and finished with a bow and long ends; or made bows may be scattered here and there among folds and drapery. Another marked change is the absence of jewelry. Even those who are fortunate enough to possess precious stones of great value, wear few at a time, and these in a plain setting. A handsome gold hutton, or stud, with a single precious stone, fastens the high linen collar, and a bow of ribbon with long ends completes the dressing for the neck. If jewelry is worn at all, it is not in sets as formerly. A long bar pin of gold, or of some fancy design, is used when a pin is needed. Ear-rings are seldom seen, except single stones of value. Bracelets are worn to take the place of linen cuffs, but they are small hands of gold, silver, or jet, with simple fastenings. Chains, locket, indeed showy ornaments of any kind, are not worn by persons of refined tastes.

Is there anything new for early fall? One of the leading "men milliners" of Paris says that "the man or woman who can invent anything absolutely new in ladies' toilets, has a fortune at command." Certain it is, those who can look back thirty or forty years, must see in the present styles a revival of those then worn, and not only is the style of making similar, but it is said the materials then used, which have been laid aside for years, are to be reproduced this fall. Among them are the handsome and durable Irish poplins, the soft delaines, and useful mohairs and alpacas. The indications are, that two or three fabrics will still be combined in one dress, as the importations show plain and figured goods to match. Many woolen stuffs have raised figures in velvet. Some richer goods have raised flowers outlined with beads. These are used for waists, and bands for trimming the skirts. Plain velvet waists will still be worn. Jerseys are used for morning and home wear only, except those made of silk, and extra fine and heavy wool, costing from eight to fifteen dollars each. Stripes are to be popular, even broad stripes of contrasting colors, as dark-red with green, ceru with brown, gray with black, etc. Blocks and squares are pretty for children's dresses. A dress of bright, rich red, over a skirt of red and dark-blue blocks, with dark-blue ribbons, is effective for a young miss. All the dark rich colors will be worn, also blue-grays, and moss and bronze-greens. The variety in woolen goods is so great, that one can suit herself as to color, quality, and price. Silk is little used for street wear, although a silk

skirt is useful with an over-dress of wool. These are made in plain designs for the street, but great care is used that the corsage shall fit perfectly, and that the drapery be graceful. If the waist is round, there should be a belt ribbon, with bow in front; it should be long with high darts, short shoulders, and high standing collar. The sleeve is high, rounded up on the shoulder, but not gathered into so much fullness as of late. It is well never to adopt any extreme in fashion; it is always short-lived. Bustles will remain, and the fashion which has prevailed in thin dresses, of two large loops and ends at the back, made of one width of the dress material, will continue for silks and soft wools. Basques will retain their place with or without vests. Polonaises also remain in favor. The back is in many cases like a princess dress, requiring only a draped front. Skirts of heavy cloth will be plain and full, without flounces; a broad band of velvet or Astrachan cloth, will trim the bottom and sides. For lighter goods, bias bands or tucks are still in favor. ETHEL STONE.

Protecting Food from Ants, Flies, Etc.

L. D. SNOOK, FLA.

During a large part of the year, flies, cockroaches, or Croton bugs, and ants, are very troublesome in the pantry. I recently saw a cheap, simple affair

Fig. 1.—THE HANGING SAFE CLOSED.

for keeping these pests at bay, and was so well pleased with it that I give the plan of construction. It consists of a box, two and a half feet long, one foot wide, and eighteen inches high, with a shelf dividing it into two compartments, as shown in the engravings. Figure 1 represents the safe closed, and figure 2, the same open. Each compartment is provided with a light hoard door. The upper one, when open, rests against the wires which support the safe. The doors are kept closed by the use of a wooden hutton or other device. The

Fig. 2.—THE SAFE OPEN.

box is held in position by four wires, *g, g*, attached to the ceiling overhead, and by crossing them the box will swing but very little. Where the wires cross at *a*, a strip of cloth is wound and securely tied, these are kept saturated with turpentine, kerosene, or other fluid offensive to the insects. By the use of this safe the housekeeper can keep insects of all kinds away from the food. The cost is very little for the materials or the time required to make it.

Useful and Ornamental Household Articles.

The bird-cage converted into a hanging-basket, as seen at the left of the engraving, makes a very pretty ornament for the sitting-room in winter. An old bird-cage can be used, by giving it a coat of paint, or regilding it. Get a tin pan about two inches in depth, make a number of holes in the bottom of it, and also in the bottom of the cage, fill the pan with rich earth, and plant some light, running vine in it; set it in the bottom of the cage, and fasten on the top by means of stout wire, as the ordinary fastenings will not be secure enough.

The music rack in the lower corner, is formed from an old-fashioned wash-stand, in the manner

Now that the days for fans are over for this year, the Japanese fan catch-all is in order. Cover one side of the fan with satin, using muslin on the other side. Make a pocket of satin, and sew it on the side of the fan covered with the same material. This forms the catch-all, shown in the lower corner. Finish with a large bow on the handle.

Catering for the Sick.

MARY WINCHESTER.

"How I wish I knew what to make for Mrs. Ellis that would tempt her appetite," said I to Aunt Lizzie, who was visiting me; "she has been a very kind neighbor, and it would be a pleasure to

going further into details with regard to my neighbor, I will add a few acceptable dishes.

CHICKEN PANADA.—Boil a young chicken half an hour in a quart of water, then pound the white meat to a paste in a mortar with a spoonful or two of the broth. Season it carefully with salt, add more of the broth and boil a few minutes. It should be of such a consistency that it can be drank, though rather thick. The remainder of the broth, with a little rice added, will do for another meal.

EGG GRUEL is at once food and medicine. Some have great faith in its efficacy in chronic dysentery. Boil a pint of new milk; beat four fresh eggs to a light froth and add to the milk while it boils; stir together thoroughly, but do not let it boil again; sweeten with loaf sugar and grate in a small nut-

USEFUL AND ATTRACTIVE DEVICES FOR THE HOUSEHOLD.

Drawn and Engraved for the American Agriculturist.

fully described in the Household Department of the September number of this year.

A pretty cover for a flower pot may be made from a Japanese fan. Cut the end sticks off, and sew the paper parts together. Run a thread through the upper part, and draw it to fit the pot; also run one through the end of the sticks, where the rivet was inserted, to keep the bottom in place. The color of the fan should form a pleasing contrast with that of the plant and flowers in the pot.

A common cigar box aids in the ornamentation of an ordinary clock, as seen in the illustration. Cut a hole in the bottom of the box, large enough to admit the face of the clock, cover the box neatly with plush, cut the opening in the plush an inch smaller than the one in the box, slash it around, and draw it through, and glue it to the inside of the box. The lid should be covered separately, and fastened on the box with small hinges, or by means of pieces of muslin glued on the inside, to serve as hinges. Fasten the clock securely in the box. The vine may be either embroidered or painted; if embroidered, it must be done before the covering is put on. Cover a small shelf for the clock with the same material, and finish it around the edge with fringe.

send in something she would relish if I only knew what. Her girl is well-meaning enough, but not exactly adapted to take care of a sick person, and her little daughter is too young to do more than wait on her mamma, as well as she knows how." For the benefit of those who have felt as I did at that time, I repeat some of Aunt Lizzie's suggestions.

That day we made milk-porridge by taking a half pint each of new milk and water, and letting them come to a boil in a saucepan. Then two teaspoonfuls of flour were rubbed smooth in a little cold water, added to the boiling milk and water, and allowed to cook an instant, salted slightly and a little nutmeg grated over the porridge.

A small gilt-band china bowl was filled with this porridge, and covered with a doiley; a bit of salt codfish was pulled into shreds and laid on an old-fashioned glass sauce plate; a cracker split and toasted, and all arranged on a tray covered with a fresh damask napkin. Little Bessie undertook to carry it across the way with many injunctions, and Robbie as body-guard to open and shut doors and gates. They returned bringing the good news that "Mrs. Ellis ate every drop and crumb, and said she felt ever so much better." But without

meg; add a little salt. Use half of it while it is warm, and the other half in two hours or so.

WINE WHEY for a patient convalescing from fever is an acceptable drink. Heat half a pint of new milk blood-warm, pour in one glass of wine, and let it remain undisturbed until the milk curdles. When the curds settle, strain it and let it cool. A spoonful of rennet water hastens the operation. It may be made palatable with loaf-sugar and nutmeg if the patient can bear it. Sherry is the best wine for the purpose.

A **BLANC-MANGE** is easily prepared, and very nutritious. To a quart of milk in a farina kettle or tin pail, set in a kettle of boiling water, add half an ounce of well washed Irish moss, and let it cook in the milk until it thickens; then strain, sweeten, and flavor, if the natural moss taste is not liked.

OAT-FLOUR JELLY may be eaten either warm or cold as preferred. To a pint and a half of boiling water in a double boiler, add an even teaspoonful of salt. Mix a cup and a half of sifted oat-flour with half a pint of cold water to a smooth paste, and stir it into the hot water; when well mixed, cover, and let it cook two and a half hours.

A Living Head-dress.

JOHN R. CORYELL.

One of the pleasant characteristics of the South American Indians is their fondness for pets. There is scarcely an animal, from the savage and treacherous puma to the most gentle and affectionate bird, that is not domesticated among the half-savage natives of the great continent. With a love of animals they have a remarkable faculty for exciting love in return, and therefore do not confine their pets in cages to pine and drag out a miserable existence, but give them full liberty, trusting to affection alone to keep them from straying away.

As is quite natural, that lively, knowing little trickster, the monkey, which is found in great numbers in South America, is a prime favorite with the lazy but good-natured and fun-loving Indians. Hence every village is full of the mischievous creatures, ready to play their pranks upon the first stranger who comes along. Among the monkeys, however, the Marmoset branch of the family comes first in the rank of pets. The Marmoset is a tiny, delicate, soft-furred creature, scarcely more than half a foot long. It is very shy of strangers,

Fig. 1.—A PAIR OF MARMOSETS.

but gives its whole heart to its friends, receiving and bestowing caresses with a tender confidence which never fails to work upon the soft-hearted, simple folk of those tropics. Moreover, it lacks the almost satanic love of mischief which is such a conspicuous trait of its cousin, the monkey.

A South American lady who kept a pair of these dainty pets, often tells with tears in her eyes of their great love for each other. For some time the marmosets lived together a perfect model of conjugal bliss. Where one went, there also went the other. In short, they acted like a pair of the most devoted human lovers. One sad day the husband died. The bereaved wife could not comprehend her loss. By every tender little artifice she tried to coax her lost love back to life, and as each effort failed she would utter a plaintive little moan and gently stroke the glossy fur of her dead lord. At last the truth seemed to come to her, and she ceased her efforts and sat beside the little body with a mournful dejection pitiful to see. The body was removed, but she made no other sign of consciousness than to put her hands before her eyes, and thus she remained, refusing food until death came to her too, and as the good lady always says: "I hope they are together now."

The prettiest and most valued of the marmoset family are the Tamarins, and of these the one called Deville's Midas is foremost as a pet, particularly with the Peruvian women, who lodge the delicate, pretty little thing in their back hair, where it stays as in a haven of refuge the moment a stranger comes near. It is exceedingly shy at first, but under the uniformly kind treatment it receives, soon becomes familiar and makes itself

thoroughly at home. It is not as intelligent as the monkey, but is quite as active, and has a very delicate sense of humor too, though it seems quite devoid of malice. It is said that out of pure wantonness it will sometimes take up a prominent position on its owner's head, and pretend to engage in an active hunt through the hair for the sort of game which sometimes is found in hair not carefully tended. While occupied in this way it chatters at the spectators as if inviting participation in the joke. If the truth must be told, the Midas, when kept by the native women, has no need to pretend to hunt for game, the chase is a real one, and probably satisfactory to both woman and Midas.

Fig. 2.—A MIDAS AT REST.

When seen skipping along the branches in the forest, the Midas, and indeed all the Marmosets, look more like squirrels than monkeys. They are in fact, however, far enough removed from the squirrel order. They not only lack the chisel-like teeth of the squirrel, but they have the great distinguishing mark of the monkey—four hands.

The Marmoset has not the prehensile tail, which is the peculiarity of most South American monkeys, and is seen in no other monkeys. The little loving Marmoset is found only in South America.

An Illustrated Numerical.—The whole contains thirty-five letters, and makes in the order numbered: a work by Dickens, one by Hawthorne, and one by Sir Walter Scott. The names of the

nine numbered pictures in the puzzle, are made with the letters contained in the three book titles.

A Red Letter Day.

AGNES CARR SAGE.

A circus was coming to town, and for weeks great red and yellow posters had adorned walls and fences, blazoning forth such wonderful sights, that every boy and girl in Summerville was half wild with excitement. Over and over again they counted their pennies saved up against the eventful day; they picked berries and ran of errands to add to the fund, and almost calculated the hours, until the trained dogs, huge elephants, educated monkeys, hair-raising aerobats, the fat woman and the dwarf, Mr. Merryman, the funny clown, and all the other marvels should appear in their midst. And at last the long expected morning dawned, hot and sultry—as circus days are apt to be, and when at an early hour the little folks rubbed the sleep from their eyes, and ran to peer over into Longstreet's meadow, there were the white tents which, mushroom-like, had sprung up in a night; the gorgeous caravans gleaming gaily in the first rays of the rising sun, and all around the delightful bustle of unpacking and arranging preparatory to the afternoon performances. But one pair of gray eyes had no sparkle of anticipation in them that day, and one childish face was very sober, as lame Benny Fenton gazed out of the side window of his cottage home, and listened to the tramp, tramp, of the hearty, healthy, country lads, flocking in the direction of the fascinating circus grounds. Benny was as poor as a church mouse, and knew his widowed mother could never spare him the twenty-five cents admission fee, even if he could make his way through the crowd on his little crutches. So he tried hard to read his favorite books and forget the event that was turning the quiet village topsy-turvy, but "misery loves company," and he was very glad when his friend and neighbor, Dolly Dutton, who was as poor as himself, came in to sympathize and console, for she was a light-hearted little soul, and her cheerful smile soon drove away the boy's frown as she said: "Never mind, Benny, I'll bring in my knitting this afternoon, and we will have a good time on the doorstep, watching the people pass by, and the wind is blowing right this way, so we can hear the music beautifully, and that will be much better than nothing, you know."—"Yes," assented Benny, "but Dolly, I do so want to see all the curious animals in the menagerie, especially the hippopotamus. I have been reading about it and spent three days learning to pronounce it, but I can't imagine exactly how it looks."—"I would rather see the 'Flying Sylph,'" said Dolly, who had studied the hand-bills. "She rides three horses at once, and flies through the paper hoops like a bird."—"It must be all lovely!" sighed Benny, "though there is no use thinking about it," but at that moment a loud shouting and racing was heard without, and both children uttered a startled cry, as on the window ledge, suddenly appeared a curious little figure, and a small, pitiful brown face was pressed against the glass.—"What is it! oh! what is it!" screamed Benny, falling back in his chair; but brave Dolly hastened to open the window, and take the object in her arms. She was not an instant too soon, for a large stone came whizzing through the air, grazed her arms, and fell with a loud crash in the middle of the floor of the room. "It is a poor little monkey," she said, "and those cruel boys are trying to stone it, but they shan't have it to tease," and she gently smoothed the round, brown head, which cuddled down on her shoulder, as though asking for protection, while the frightened little creature chattered mournfully.—"How cunning he is!" said Benny, now all animation, "and do look at his scarlet coat, and hat, and feather! He must have run away from the circus and been chased down here."

By this time the small yard was besieged by a party of large, rough youths, who loudly demanded the monkey, saying that they "wanted to have some fun with it." But Dolly only clasped the trembling animal tighter and closer as the rude voices grew more threatening, and Benny, though pale and frightened, advanced to the window,

shook his head at the crowd, and declared they would never give him up for their cruel sport.

"We'll soon make mince-meat of a little shaver like you, and have our prize whether or no," shouted one larger lad, starting to climb in at the window, while the crowd prepared to follow their leader, and it might have gone hard with the brave little pair, as well as the poor animal, if a tall man, followed by a black French poodle, had not suddenly appeared upon the scene, ordered the ruffians to desist, and knocked loudly at the cottage door. Leaving the monkey in Benny's arms, Dolly, still pale and trembling, hastened to open it, and was reassured by the kindly smile of the new comer, who said, "I hear you have saved some of my property for me, and I have come to take the runa-

jokes, that the children were in continual peals of laughter, while the crowd without pressed against the window to catch a glimpse of Benny's circus."

"I never saw anything so cunning in my life," gasped the boy, as exhausted with laughing he lay back in his arm-chair; and Mr. Merryman rose to depart, saying: "Well, you must both come up to the tent this afternoon, and see Jocko and Phil in their other tricks."—"We can't," said Dolly sadly, "for our mother cannot spare the money. Then turning aside, Mr. Merryman took from his pocket two blue tickets and handed them to Dolly, saying: "Those will admit you both, and may perhaps be a slight reward for saving Jocko from his persecutors, I will see that you have seats reserved for you directly in front," and before they could utter their

home, Mr. Merryman came to shake hands and bid them good bye. He smiled at their rapturous delight and shower of thanks, and said: "I am glad you have enjoyed it; and always remember to take the part of the weak as you have done to-day. Kindness to either man or beast brings its own reward."

Boating and Canoeing as Recreations.

Sea-side resorts, such as Coney Island and Rock-away, are not the only places to which New Yorkers betake themselves for a few hours of fresh air and cool breezes. There are at the commencement of Long Island Sound several charming retreats where, to the beauty of the quiet water scene, is ad-

OAK POINT DURING THE BOATING SEASON.

Engraved for the American Agriculturist.

way home."—"Please walk in, sir," said Dolly, dropping a quaint old-fashioned courtesy, and she conducted him to the neat little room where Benny was keeping guard over the miniature gentleman, who was chattering like a dozen magpies, although his pursuers had beaten a hasty retreat.

"Well, master Jocko!" exclaimed the visitor, as the monkey sprang joyfully to meet him. "So you thought of taking French leave, did you! and would likely have been killed, had it not been for this kind little lady and gentleman!"—"Oh! please let him stay a little while longer," pleaded Benny, and Dolly's beseeching eyes said the same.

"Perhaps you would like to see him ride," said the man, and to the unbounded delight of the children; he called up Phil, the French poodle; instantly Jocko leaped on his back, and round and round the small apartment they went on a lively gallop, the monkey holding on by the dog's curly hair, and seeming to enjoy it as much as the spectators. Then Phil went through some of his accomplishments, such as jumping over a cane, standing on his head, and performing a "Highland Fling," with the utmost gravity and sedateness, while his master, who proved to be no other than Mr. Merryman himself, told such funny stories and

thanks, he had shouldered the monkey, whistled to Phil, nodded a gay "good bye," and was walking rapidly up the road. Mr. Merryman was better than his word, for he sent the prettiest little carriage, drawn by two tiny Shetland ponies, no larger than Newfoundland dogs, to convey Benny to the grounds; and of course Dolly rode with him in grand state, the envy of all the girls and boys in the village, who trooped merrily after the dainty equipage. Benny's face was a picture, and Dolly nestled with delight among the soft cushions. And once within the magic tent, what a wonderful afternoon they passed; even the molasses lemonade, and odor of sawdust and orange peel seeming delightful, for it was a glimpse into a new world, and fortunately they could not see behind the scenes. How they admired the beautiful horses in their gay trappings! how they held their breath during the daring feats on the trapeze! and how loudly they applauded when Phil and Jocko came dashing into the ring. Oh! it was a red letter day indeed in the sombre lives of these poor little ones, who had so few of the pleasures of childhood; and one they will live over and over again in time to come. And when at length the entertainment was at an end, and the little chariot stood waiting to take them

ded that of trees, shrubs, and grass. We here reproduce from drawings furnished us by the Park Commissioners, a spirited engraving of one of these favorite resorts, viz.: Oak Point, as seen by one of our editors in his frequent drives about the country in search of information for the *American Agriculturist*. One visiting this point on any day in summer, will find book-keepers and salesmen in their four-oared shells, engaged in friendly contests. Others in frail-looking craft ply the paddle in canoe races. All find in broad chests, strong arms, and a healthful glow of faces, that an occasional holiday at the oar and paddle overcomes the ill effects of confinement to the desk and salesrooms. Besides this, friends of both sexes are interested in amateur boating and the holidays have their social features. There is probably no more complete exercise to call into play the muscles of the whole body, than to tug at the "ashen sail." It is a form of exercise in which young people in the country may engage more frequently than they do. Boat clubs in rural neighborhoods will not only benefit active members, but their meetings will form occasions for the gathering of their young friends, and add to the social opportunities of which there are none too many in our rural life.

The Doctor's Talks.

"Tell us about Flies," writes one young correspondent. "Where do they come from, and where do they go in winter? Are there different kinds of flies?"—While some naturalists think that our house flies are the same as the house fly of England, and the rest of Europe, others regard them as different. Singularly enough, none of our naturalists have studied our house fly, and observed its transformations, and all that we know of the life history of this very common insect is from observations made in Europe. Flies, like most other insects, have a larval or maggot state; when the maggots are full grown they pass into the pupa or chrysalis form, from which (in England in fourteen days) they come out as the perfect insect or winged fly. It is pretty well known that house flies pass their early life as maggots in manure, and, as most are aware, are more abundant in the neighborhood of stables than elsewhere.

FLIES DO NOT GROW.

I have more than once heard persons speak of seeing young flies in the spring, evidently thinking that the small flies they may meet with, are young individuals and will grow to their full size. When the flies come out of the chrysalis, they are as large as they ever will be, and if some are smaller than others they are different kinds of flies. The same is true of moths and butterflies.

THE FOOT OF THE FLY.

It is well known that flies can walk up a smooth pane of glass, and along the ceiling with their bodies downwards without falling. The foot of the fly, when examined by a powerful microscope, is found to have numerous hairs upon it, each with a little disk at its end. It is thought by most naturalists that the fly can use these disks as a boy uses a leather sucker, to enable it to cling to smooth surfaces. The eyes of the fly are very large in proportion to the size of the head. The microscope shows that these are not simple eyes, but curiously made up of separate facets, each of which is really an eye. The two compound eyes of

opens and spreads out two flat leaves, which enable the insect to lap up liquids. These leaves are rough like a rasp, and with them the fly can tear delicate surfaces; it often disfigures the covers of books by scraping off their polish. It also uses these rough leaves on our skin, and we say "the flies bite." According to an English naturalist, flies really have teeth. I give his engraving in which the teeth of one lip of the house fly are shown, of course greatly magnified. The three

was it but a big bull-frog! Charlie's eyes grew as large as saucers, as he exclaimed—"Frenchmen eat 'em!"—"But we are not Frenchmen" said Eddie, "and I don't think mother would like the ugly things." But Charlie had found new sport, and quite as interesting as trout fishing to these small boys, whose energies were now bent on "frogging." So as soon as they spied a frog floating with its nose out of the water, they would throw the line towards him, to invite him to make a jump for the

bait. In this way they caught quite a number. Finally Eddie saw a huge frog sitting on a log near the bank. He tried to coax him by tickling his nose with the bait, but Mr. Froggie was much too dignified to bite, and only said "plunk! plunk!" without so much as stirring. At last Eddie, determining to get him, waded out in the mud and water, reaching, grabbed him in his hands, and amidst kicking and struggling, managed to bring him in triumph to shore. The boys by this time having a big string of frogs, and feeling tired and hungry, started across the fields for home, now and then picking up an apple, and eating it as they walked.

On reaching home they marched straight to their mother, who laughed heartily at the result of their day's sport. She said "I don't want them, but you can ask Jane if she'll cook them for you." The boys, in great delight, took them to the cook, and

holding them up with much pride, asked her to cook them, saying, "Frenchmen eat them!" But Jane, who disliked frogs above all things, exclaimed in horror—"It's a Frenchman that aches them you say, the hathens—the Turks, and is it me that would be after cooking the likes of 'em. Throw 'em to the pigs—sure a Dutelman wouldn't eat them!" That night, when Eddie was in bed, he saw hosts of frogs sitting on the counterpane, bewailing the loss of their friends. One said "where is old 'Chime'!" another, "where is my little 'toddly' my darling 'cheehunk!' and pretty 'plunt!' and oh where, where is dear old 'daddy'." One great fat frog cried out: "What shall we do to the cruel boy that hooked our loved ones!" Then all the others said "Plunk, plunk," and Eddie was so

Drawn (by W. M. Cary) and Engraved for the American Agriculturist.

largest objects with rough upper edges are the teeth. These are not of bone like the teeth of the higher animals, but of "chitine," a peculiar substance of which the hard parts of insects consist. A large share of the flies die at the end of the warm season, but enough to keep up the stock hide themselves in nooks and crevices, and there pass the winter. They come out of their hiding places on the return of spring. The blowfly, the cheese-fly, and others are very different in habits from the house fly.

Frogs by Day and Frogs by Night.

Charlie and Eddie were two little boys who lived in the country. Near their home was a fine stream which contained plenty of nice speckled trout. One bright morning the two boys started with their poles and a box of worms to try their luck at catching some of the pretty fish. And over the hill and down in the meadow they trudged until within sight of the brook, which they hailed with shouts of delight, and anticipations of a big surprise for mother. "Hurrah!" said Charlie, as he threw himself down on a rock to bait his hook; "just wait and see if I don't get some of those speckled beauties!" But he did not know the difficulties attending it. After tumbling into bushes and over logs, throwing their lines in here and there, they tried in vain to get near the big logs where they were sure father used to catch such beauties. But whether the trout were too shy or the bait not quite right, certain it was that they failed to get a single bite. Further on they found a lot of cattle standing just at the place where they wanted to make another trial. The cows stood coolly switching their tails to brush the flies off their backs. It was useless to attempt to fish there. In the mean time Eddie lost his hooks in a sunken log in the bottom of the stream, and had to make the best of a bent pin for a hook. Greatly discouraged they wandered further on to a pond near by. Here they found the water very low—the sun having nearly dried it up. However, they threw in their lines—when in a moment Charlie exclaimed! "Ed—I have a bite!" On pulling out his line, what

RETRIBUTION.

frightened that he sat up with a start, to find that he had only been dreaming, and that daylight was peeping in between the window-curtains. The reader will observe, from the engravings, that the frogs in the dream were much larger than those in the stream. We may imagine that they felt their importance, when asking for information about their near relatives, and looked as big as they could while seated around upon the counterpane.

TEETH OF A FLY.

the fly are made up of about four thousand simple ones. Human beings have only two simple eyes.

THE PROBOSCIS OF THE FLY.

The so-called trunk or proboscis of the fly, which, when not in use, is bent up under the head, is really a tongue, with a knob at the end. When the fly comes across anything sweet, this knob

An Illustrated Rebus.—The above rebus contains two familiar lines of poetry by Bryant, specially suited to this sad season of the year.

Our Gallery of Dogs.—Pugs.

Last month we gave a spirited engraving and description of the Scotch Colley. We here with present illustrations of typical prize pugs. Pug dogs are not over wise, but extremely loving and make devoted pets. They are consequential to the last degree, and as full of self-importance as young Bantam cocks. How amusingly dignified

sion peculiar to itself. The eyes are large, dark, and full, with a queer squint, and the ears, small, black, lying close to the cheeks. The neck of the pug is strong, the chest square, legs short and straight, and the tail curled close over the hip. Master Pug's coat is short, close, and soft, and very variable in color, the pure apricot fawn being the most aristocratic. A well defined black mask is upon the face, and a line of the same color extends along the spine. This "stripe" is a good characteristic of a fine pug. If twelve to fifteen inches high, and weighing ten to fifteen pounds, when full-grown, the pug is large enough for all the purposes for which it is tenderly reared.

Shall we Destroy the English Sparrows?

The English Sparrow (*Passer domesticus*), was introduced into this country about a quarter of a century ago, to exterminate the much dreaded span-worm, then devastating the city parks and lawns. Sixteen years ago we made, from life, a fine engraving of these English sparrows, and stated that the price for the imported worm-destroyers was four dollars per pair, and in many cases persons who had the birds upon their premises were unwilling to part with them at any price.

The sparrows did their work very effectively, it being estimated that a single bird consumed nearly three hundred caterpillars per day. But the impudent, noisy, and quarrelsome sparrows have been very prolific in their new home, and with six broods a year, they have increased rapidly, and driven out many of our finest songsters. They came to stay and to occupy the land. The feathered deliverer has proved a nuisance, possibly greater than the insect enemies they were imported to destroy. This bird engaged the serious attention of the American Union of Ornithologists at its October meeting in New York, and after the

upon the sparrows may be wise, provided it is no carried too far. We are all prone to underestimate the value of birds, as shown by the treatment of the much maligned crow, and it will be well to move slowly upon the sparrow, and make notes by the way. There is a balance to be maintained between the bird and insect world. We had good reason for importing the English sparrow, and he did well the work assigned him. Instead of the cry "the sparrow must go," why not try to restore the equilibrium by reducing the numbers of this invited guest? This will doubtless be the upshot of the whole matter. The English sparrow, now so abundant, cannot be annihilated in a single season.

A Visit to the Founder, and for 14 Years Editor of the American Agriculturist.

A large portion of Ocean Co., N. J., is occupied by the "Pine Barrens." The traveller on the New Jersey Southern Railroad, soon after leaving Red Bank, notices a marked change in the face of the country, and by the time he reaches Manchester, he is in the midst of what a superficial observer would say were properly called "Barrens." The soil, if white sand and yellow gravel can be so called, is covered by stunted pines, scrub oaks, and other small trees, with an undergrowth of shrubs. The vegetation has left but a shallow stratum of mould upon the surface, and the country is, to appearance, most inhospitable to agriculture. This tract extends to the ocean at Barnegat Bay, and is well known to botanists as producing many plants not found elsewhere north of the Carolinas, and some occur that are peculiar to this locality.

A few miles from the ocean, in Dover township, about a hundred miles from New York, is the summer residence of the venerable founder of the *American Agriculturist*, Mr. A. B. Allen, who has some fifty acres directly upon Tom's River, a stream, the beauty of which warrants a better name. I had not met Mr. Allen in a number of years, and were surprised to find that time had made scarcely any change in his tall, erect figure, in the elasticity of his movements, or in the genial expression of his face, as he welcomed us in our unexpected visit. The portrait on page 483, while it satisfactorily presents his features, can not give the color of the hazel eyes, or the fair, slightly florid complexion; these, with an ample forehead, as yet unfurrowed by wrinkles, make him appear much younger than he really is. Indeed, he carries his eighty-two years more lightly than many do their burden of three score and ten. Impressed by the unpromising appearance of the country we had recently passed over, I asked:

"What could have induced you, Mr. Allen, with your well-known love of agriculture, and taste in rural matters, to locate in such a barren region?"

"I shall convince you that barrenness is in appearance rather than in reality, but the inducement was solely its healthfulness. A member of my family, a confirmed invalid, found in former visits, that the climate agreed with her better than that of any other locality, and about fifteen years ago I bought this place of about fifty acres. We have a perfectly pure atmosphere; even after the most sultry days the sea-breezes are cool at night. We have a clear and beautiful river for boating or bathing, and the ocean is close at hand. Then the roads are fine and dry; even directly after a rain there is no mud, which is a great comfort."

"But the utter barrenness of the soil?"

"Look at these trees. The place, when I bought it, was an abandoned peach orchard, and every tree here, save the red cedars, and a few others that came up from seeds, I planted since I came. Look at the lawn, is not that a fine, close turf?"

A drive about the neighborhood, and through Mr. Allen's own place, showed that the soil, notwithstanding its appearance, will respond to cultivation. The place adjoining Mr. Allen's is a large dairy farm, upon which heavy crops of corn had just been cut, and the pastures bore a satisfactory turf. Trees, both deciduous and evergreen, of course planted without manure, had made an am-

PRIZE PUGS.

Engraved for the American Agriculturist.

they try to appear. They know very little of bravery. A gamy cock will quickly decide any differences against a pug, and drive him from the poultry yard. The Dutch have a special fondness for the pug, and in Holland this old breed is a common one. The pug has a round head and a high skull, with a very short and broad muzzle. With the brow prominent and beautifully wrinkled, and the nose turned up, the pug obtains a facial expres-

sion of convicting evidence from all parts of the country, it is declared, by the highest bird court in the land, a positive pest to all concerned.

Methods will now be perfected for the wholesale destruction of this bird nuisance, which may lead to its ultimate extermination. It may be that one extreme will follow another, and in the extermination of the sparrow we may offset one depredation with another equally bad that may follow. A war

ple growth. The soil is well adapted to market gardening, it is early, and the ease with which it may be worked, is a point greatly in its favor.

"Was your father a farmer?" I asked our host.

"My paternal ancestor came from England and settled in Massachusetts, purchasing a considerable tract of land in the town of Roxbury. He carried on a combined business in merchandise and agriculture. I was born in Hampshire Co., Massachusetts, in 1802. My father afterwards moved to New York, where he continued his double occupation as before, and also educated his sons."

"When did you go to what was then the West?"

"I moved to Buffalo, N. Y., in 1833, where I devoted myself to agriculture, especially to the breeding and raising of domestic animals of all kinds. In 1841 I went to England for the purpose of studying its agriculture, and also to select and import choice domestic animals, with a view to improving those already possessed at home."

"What induced you to become an editor and to start the *American Agriculturist*?"

"Solely a desire to improve our agriculture. I had recently returned from England where everything relating to agriculture is so different. The thoroughness of the cultivation was in marked contrast to our own. There was in England a great interest felt in the improvement of cattle and other domestic animals, while there was very little at home. Thinking to serve the interests of agriculture, in conjunction with a younger brother, Richard L. Allen, the publication of the *American Agriculturist* was commenced in the City of New York, though we still continued our farming at Buffalo. The first number of the paper was issued in April, 1842. Finding it inconvenient to attend to editorial duties so far from the place of publication, I moved to New York near the end of the year, giving up my farm to my brother. I have since lived in the city, or in the country near by. At the end of the first year R. L. Allen retired from the *American Agriculturist*, and I assumed the entire editorship. I conducted the paper alone until 1849, when I was again joined by my brother."

"Why did you cease to edit it?"

"Wishing to devote ourselves to other business, which required our sole attention, we, after publishing it for fourteen years, sold the *American Agriculturist* to a gentleman who had been with us for a few years as an editorial employé. The subsequent history of the paper you know better than I."

Knowing that Mr. Allen had been a pioneer in the manufacture as well as the sale of agricultural implements, I remarked: "In your long experience you must have witnessed great improvements in agricultural implements and machines."

"When I commenced dealing in them, no implements of improved kinds were kept in the City of New York. The only things of the kind then offered were a few coarse cast-iron plows, a common, rough kind of harrow, and shovels, hoes, etc. I visited Worcester, Mass., and other places where improved implements were made, and filled my warehouse with them. My brother was associated with me soon after I had commenced the business. The trade rapidly extended all over the United States, to the West India Islands, and to South America. Others followed the example, and the agricultural implement business of the city is now very large and is constantly increasing, especially in exports. We erected a large factory in Brooklyn, where we made all the ordinary implements, and after mowing and reaping machines came into general use, these were also largely made by us."

"Did you not make some inventions yourself?"

"I took out a number of patents, but these were mainly for improvements in reapers and mowers, and also some were for improvements in plows."

"Was not the importation of high class live stock, especially cattle, a part of your business?"

"Yes, and besides our own, considerable importations of improved breeds of domestic animals of all kinds, friends in England frequently consigned to me improved stock for sale. Indeed, this has taken place down to a very recent date."

"Have you visited Europe since 1841?" "I made quite an extended tour of the continent in 1867,

finishing off with a turn through England and Scotland, where I again studied their agriculture."

Mr. Allen retired from business a number of years ago. He passes the summers on his farm in Dover township, N. J., and the winters at Flushing on Long Island. His continued good health and a vigor quite unusual in an octogenarian, are no doubt due to an active participation in the outdoor work of his place. He knows, and can give the history of, every tree on his grounds. He still continues to plant trees, knowing that some one will gather their fruits or enjoy their shade. Still more remarkable than the activity of body are his unimpaired mental energy and retentive memory. Few young men keep so well abreast of agricultural progress, or are so well informed as to new methods and appliances. In relinquishing the editorial chair, Mr. Allen by no means abandoned writing, for he has been, and still is, a contributor to various journals, including the one which is proud to acknowledge him as its founder, and for which he still has something of parental regard. Though he writes upon agriculture proper, and various rural topics, his special field is that of domestic animals, especially neat cattle. There is probably no other person who has so thorough a knowledge of the early importations and the history of their progeny as Mr. Allen. In view of the fact that a large share of our beef cattle must be drawn from the ranges of Texas, where the redundancy of horns, derived from the Mexican cattle, still prevails, Mr. Allen long ago advocated the introduction of males of some of the polled breeds, in order to get rid of the enormous horns, which greatly increase the difficulty and cost of the transportation of the cattle to market. The suggestion was an eminently practical one, and the occasional appearance of polled grades in the herds, shows that some have been wise enough to act upon it. The present general excellence among the swine of the country is largely due to the writings, and especially to the importations, of Mr. Allen, who was among the first to introduce the improved Berkshire breed, and to point out its value to our farmers. These are instances in which the labors of Mr. Allen have been of national importance, but his efforts for their improvement have extended to all other kinds of domestic animals, and these are still continued.

Our visit to the founder and first editor of the *American Agriculturist*, though of necessity brief, was full of interest, and we left him, feeling that at least one man had learned the art of growing old, not only gracefully, but usefully.—G. T.

Animal Ailments.

DR. D. D. SLADE.

HEAVES IN HORSES.—S. S. Danbenspeck, Butler Co., Pa., has a horse that is serviceable, but he has the heaves. Although the term heaves is used with a good deal of latitude, yet in all cases it implies some disturbance of the respiration. Whatever may be the exact abnormal condition of the air cells, all cases are rendered less troublesome and more endurable by strict attention to the quantity and quality of the food. This should be given in small compass, and with great regularity. Provide roots and green food, and limit the supply of water. Feed dry oats and very little hay, only at night—the object being to prevent distention of the stomach, and consequent indirect pressure upon the lungs. Give slow and regular exercise, but never until an hour or two after eating. The air cells probably will never regain their original healthy condition.

"HOOF-BOUND."—Donald Chrisholm, Cape Breton, has a nine-year-old horse that is "hoof-bound," and has hoofs rather inclined to be flat. The walls of the hoof above, especially of the fore feet, are hollowing in from the heel to the toe.—This condition is dependent upon precocious inflammation of the sensitive tissues beneath the external wall or horny crust, leading to a separation of these tissues from the hoof, and a consequent sinking in of the front of the foot, and generally a bulging out or convex form of the sole. No treatment can restore the hoof to its natural shape and condition, but an animal may continue to be serviceable in slow work. This condition of the feet must be considered as an unsoundness of the animal.

LAMPAS.—A. Murray, Fairfield Co., Conn. This congested condition of the hard palate and gums in young

horses, may be materially relieved by scarifications with the lancet, as are the gums of young children in teething. The application of Lunar Caustic also has a good effect. Burning the parts should never be practiced. In feeding, the animal may continue at pasture, or if kept up, fed on green food and bran mashes, until the soreness has passed off. Then the usual grain and hay may be offered. There can be no objection to offering hay at any time. In fact, some authorities advise feeding of hard, unshelled corn as often exerting a salutary effect upon the abnormal condition of the mouth. Treat the animal as you would a child suffering from a similar cause. A mild dose of physic is often beneficial.

CONTAGIOUS DISEASE AMONG PIGS.—E. W. Daft, Clayton Co., Iowa, asks us for information about an obscure disease which has existed among his pigs for the past two years, and which attacks them at from ten days to four weeks old. The disease manifests itself by ulcerations about the mouth and nose, on the gums and tongue. Does not affect all the pigs sometimes a portion of the litter escapes. The disease first made its appearance in a house with a board floor. It does not attack the sows or hogs. It has generally proved fatal.—It is difficult to determine from the imperfect data given, what may be the precise nature of the disease in question, whether it should be classed as anthrax, or as swine plague. However this may be, it is a contagious blood disease, manifesting itself particularly among the young animals, and will continue to do so as long as the present premises are occupied. Separate the sick immediately, and destroy them; place the healthy pigs in new and comfortable quarters, at a considerable distance from those which have been occupied. Burn or bury deeply the dead. Entirely disinfect the old quarters, destroying all rubbish, hay, straw, wood-work, etc., that has come in contact with the disease. In short, stamp out the malady. Attempt no medical treatment.

CUTTING AND INTERFERING.—R. G. Houston, Sussex Co., Del., has a young mare that strikes just below the knee, and also interferes behind.—These conditions may depend upon weakness or fatigue, but when these become a habit, they are most probably the result of faulty construction of limbs. To remedy these defects, remove a portion of the inside of the shoe, which should be of equal thickness throughout, or straighten the shoe on the inner margin, and after its application, reduce the wall or crust to correspond to the shoe. In this way, striking the opposite limb with either hoof or shoe is avoided. Of course the nails should be placed in front of or behind the cutting portion.—There will be no difficulty in drying up the milk of a mare; there being no call for the secretion, it will soon disappear. Nature is the best guide in such matters.

IMPEDED RESPIRATION.—C. H. Mitcheltree, Mercer Co., Pa., has a mare, eight years old, that puffs and blows on exercise, but has no cough.—The animal may have some impediment in the nostrils, which may prevent free dilation, and the lungs be perfectly healthy, or there may be more or less disease of the lungs, causing what is known as "thick wind." In either case, the animal should not be used for one or more hours after feeding, and the food restricted to good sound oats and little hay. Green food in moderate quantities may be given, or the animal may be turned out to pasture. Very little water at a time should be allowed, except at night. Give regular and gentle exercise daily.

WOLF TEETH.—J. Boor, Fulton Co., Pa., asks whether wolf teeth injure a horse, and what is the cause of them.—The teeth which have received this name, are small supplementary molars or grinders, which appear in front of the true ones, having little or no resemblance to these last, and are most frequently shed with the first milk molar, and are not replaced. Occasionally they are not shed until the animal has passed the age of colthood. When retained they are perfectly harmless, and the idle stories which connect these teeth with various diseases, are but the result of gross ignorance and superstition.

BURSAL SACKS.—R. Drumm, Columbia Co., N. Y., has a mare fourteen years old, that has always had wind-galls, but these have never troubled her until lately, when she became very lame from them.—The treatment in such cases is to subdue the inflammation in the parts by rest, and by lotions of cold or tepid water, restricted diet, and, if necessary, by a gentle purgative. When the heat and tenderness have gone, give support to the limbs by well applied flannel bandages, moderately tight at first, but increasing the pressure afterwards, for a portion of the day at least. If lameness continues, and there is any hardness like bone, cut off the hair, and as a counter irritant rub in mercurial ointment for several minutes, by means of a bit of cloth or flannel. This may be repeated from time to time. Active blistering, and even firing, both of which should be done by competent hands, may become necessary. Under all circumstances entire rest of the animal must be insisted upon, and the return to work should be very gradual.

MASON C. WELD.

What a Single Number Contains.

The wonderful variety, both in matter and illustrations, presented in a single issue of the *American Agriculturist*, under the changes and improvements inaugurated last June, are indicated to some extent by the following brief summary of the leading features of this November number:

The portrait of the Founder of the *American Agriculturist*, the venerable A. B. Allen, will pleasantly remind many readers of the early days of this Journal, while the account of a recent visit to him will inform them that he has lost none of his love for and devotion to agriculture. In "Walks and Talks," Joseph Harris, besides other matters, presents experiments by Messrs. Lawes & Gilbert, in the use of superphosphates upon potatoes, giving important results not before published in this country. That farmers owning good mares should breed salable work-horses, is enforced by Col. M. C. Weld, and illustrated by Forbes, in life-like portraits of Peheron and Clydesdale grades. The same writer, in "Among the Farmers," has useful hints upon Silos, and also describes a superior Shorthorn cow. David W. Judd, in Editorial Notes, presents matters of interest to those living in the West, and to those who contemplate going there to establish a home. The peculiarities of German Farming are described and abundantly illustrated by Alfred Trumbull. Trapping Rabbits, which are the great pest of the Australian farmer, affords subjects for an article and several engravings. The Ailments of Domestic Animals are prescribed for by Professor D. D. Slade, of Harvard University. J. W. Powell treats of Forest Fires, which cause such an annual loss of timber. Timely information on Poultry is given by D. Z. Evans, Jr. Shelters for Swine are described by J. M. Stahl, of Missouri. That farmers may be legally held liable by those they employ, is shown by H. A. Haigh, of Michigan. In some far western regions hay is the cheapest fuel; the method of preparing it is described and illustrated by R. G. Newton, of Dakota. Doctor B. D. Halsted writes on Old and New Breeds of Canaries. The Ox Bot-fly, The Prize Pigs, Shall we Destroy the English Sparrow, and other topics. The Relation of Plants to Health, and How to Water Plants, are discussed by James Sheehan. Elias A. Long describes and illustrates the best manner of laying out small Front Yards. Doctor George Thurber describes a Fish-killing Plant, a New Race of Pears, Fruit Without Flowers, tells what Sphagnum is, etc. Seasonable directions for the management of Bees, are given by W. Z. Hutelinson, of Michigan. Home-made farm conveniences, long a characteristic feature of this journal, are here represented by several Gateways and Gates, an Improved Saddle, a Clod-crusher, a Wagon Jack, a Wheelbarrow with Springs, etc. Especially timely articles are, Care of Pigs in Winter, Watch the Flues, Underdraining in Winter, Hints About Work, etc., etc. The Household has the usual useful variety; Converting a Closet Door into a Wash-stand, is illustrated by Mrs. Bushyand, of Illinois. Mrs. Welsh gives directions for making several useful and ornamental articles. L. D. Snook, of Florida, describes and illustrates as easily made Meat

Safe. Mary Winchester gives hints on Catering for the Sick, and Ethel Stone has notes on Autumn Styles in Dress. The Boys and Girls have two stories; one by Miss Sage, A Red Letter Day, and one by W. M. Cary, who illustrates the doings of some boys and frogs. The curious ways of the Marmoset are described and illustrated by J. R. Coryell. The Doctor Talks about the ways of Flies, and an article on Boating and Canoeing will interest the older boys, while the beautiful picture, illustrating it, will please all. In numerous short items, including "Chats" and "Basket," the inquiries of many subscribers are answered, and a vast amount of information compressed into a small space. A number of new Books are noticed, and several important Swindling Schemes are shown up in the Humbug Columns. There are three full-page, and nearly one hundred other illustrations by such leading artists as Forbes and Bennett.

Award of Prizes for Stories.

After a careful reading, and re-reading of one hundred and sixteen stories, sent in competition for the prizes offered in the June *American Agriculturist*, the judges render the following decision:

1st Prize, \$50, to JULIA M. POTR, Summit, N. J.
2nd Prize, \$30, to AGNES CARR SAGE, Brooklyn, N. Y.
3rd Prize, \$15, to JOHN R. CORYELL, Brooklyn, N. Y.

Honorable mention is due to several other competitors, namely: M. E. Bamford, R. H. Adair, S. May Norton, B. Haymond, Daisy H. Clark, Gertrude Christian, Mrs. J. Breckinridge, Mrs. Walter Mills, Fred Grundy, Miss J. D. Thompson, S. E. Boggs, Anna L. Hopkins, Miss Isabel Smithson, and Amelia H. Botsford. Twenty-eight States are represented in the list of competitors, and one of the stories comes all the way from New Zealand.

Chat with Readers.

A Weed for a Name.—"W. R.," Andes, N. Y. Had the full name been given, you would have had an earlier reply. The plant is Mugwort, *Artemisia vulgaris*, own brother to Wormwood, which, as you suggest, it resembles, but differs from it, among other points, in having its leaves dark-green above.

About Meal Worms.—An inquiry in a former number, asking how to keep meal worms, is answered by M. Zehler, Montgomery Co., Ohio, who says in reference to his experience in Europe: "We placed the worms in a box with bran, shipstuffs, and woolen rags all in tatters. We always had as many worms as our nightingales and larks required."

A Weed in Oats.—J. Phail, York Co., Pa., sends a plant with a milky juice, the root of which is so deep he has failed to find it. The plant is Flowering Spurge (*Euphorbia corollata*). On account of its numerous, small, white flowers, it is sometimes cultivated as an ornamental plant. A succession of hoed crops will probably exterminate it, but it is very tenacious of life.

Osage Orange Seeds.—G. Terrill, Jefferson Co., West Va., has an abundance of the fruits of Osage Orange, and wishes to know how to separate the seeds. The balls should be placed in a heap, where cattle can not reach them, and allowed to thaw and freeze all winter. In spring they will be found soft and partly decayed, when the seeds may be separated by crushing the balls in a barrel or box, with a wooden pounder, and washing away the pulp, etc., from the heavier seeds.

"Is it Good for Hay?"—Chess or Cheat (*Bromus secaltinus*), a common weed, especially in grain fields, is a tall, showy grass, and frequently sent us for a name. Those who do not know the grass, usually ask us its value for hay. None of the species of *Bromus* rank high as nutritive grasses. The one in question was offered many years ago as "Willard's Bromus," but after a thorough trial before cattle, swale hay was eaten in preference. It is an annual, sometimes a biennial, and worthless in agriculture.

Fruit in Missouri.—H. Schultz, Kings Co., N. Y. Missouri is an important fruit-growing State, and its Horticultural Society is showing enterprise in publishing a Monthly Report, giving fruit statistics by counties. The yield of apples, in the entire State, is fifty-eight per cent. of a full crop. The varieties standing highest are: first, Ben. Davis; second, Willow Twig; third, Smith's Cider. The grape crop will be only about fifty per cent. of the average. The Society will make a large display of fruit at the New Orleans Exhibition.

"Egyptian Evergreen Millet."—C. H. Smith, Yellowstone Co., Mont., sends us a specimen of grass, the seeds of which he received from California with the above name. He would know as to its value, and if likely to become a weed. The grass in question has several names, but is most extensively known as Johnson Grass, *Sorghum halepense*. In the Southern States it is highly esteemed, to feed green, and as hay. Some parties in Georgia and Alabama raise it on a large scale for baled hay. It is hardly likely to become a troublesome weed in the Northern States.

Abundant Bloom but no Cherries.—Jas. P. Smith, Howard Co., Ind., has several trees which are full of bloom each spring, but the fruit falls off by the time it is half grown. The loss of fruit may be due to the insect that is so destructive to the plum—the Curculio. Spread sheets on the ground beneath them, and give the trees a sudden jar. Commence this soon after the fruit sets, and if the insects are the cause of the trouble, some will be caught, and show that the jarring should be continued as long as any fall. If not the curculio, lack of nutrition is a probable cause, and a moderate manuring may be tried.

Remedy for Cockroaches.—G. E. Teeple, Summit Co., Ohio. Pyrethrum powder, whether the imported "Persian," or "Dalmatian," or that made in California as "Buhaeh," if persistently used, will free the house of cockroaches. Remove everything from the closets, and blow the powder, using a small bellows made for the purpose, into every crack in these, and in the room. The insects will come from their hiding places, fall to the floor and die, or be too much stupefied to move, and may be swept up. Repeat the operation every few days, until no more, young or old, are observed.

Preserving Grape Juice.—C. W. Dearborn, Alameda Co., Cal. The so-called "Grape Milk" is a preparation of which the makers hold the secret. Grape-juice can be preserved by treating it the same as fruits are in canning them, i. e., bring it to the boiling point, and bottle and cork it while still hot. While this would preserve the juice so long as air is excluded, it is probable that fermentation would soon commence when it was opened, and in contact with the air. We have had no experience with salicylic acid as a preserving agent. We should prefer not to use it until more is known about its effects on the system.

A Plant for a Name.—J. M. Davis, Essex Co., Mass. The orange-colored slender stems which hang like tangled threads upon various wild plants in low places, belong to a kind of Dodder, or *Cuscuta*. There are a number of species, and as it has not yet flowered, we can not say to which the one sent belongs. These plants start from the seed, and the slender stem soon attaches itself to some other plant by means of small sucker-like disks, through which it robs the supporting plant of its nutriment. After it is fairly established, the lower part of the stem connecting it with the soil dies away, and the dodder henceforth subsists as a parasite.

Strawberries in Autumn, and Pegging down Runners.—F. K. Ripley, Middlesex Co., Mass., sends us some strawberries that ripened in September. In a warm season, it is not unusual for some of the flower buds, which are prepared for next spring, to be forced into flower, and even ripen the fruit in the fall. He writes: "I should like to tell those readers who have a small bed of strawberries, how easy it is to direct the runners, and have them take root in the desired place. Take a common wooden toothpick (five cents buys a large box), bend it in the middle, and with one point on each side of the runner, thrust it into the ground. This obviates the use of stones, chips, etc., to hold the runners in place."

Cloth in Place of Glass.—C. S. Tiffany, Putnam Co., Fla., asks us how cloth is prepared to use on a cold-frame in place of glass. The preparation used by the late L. C. Root, of Illinois, who employed cloth (sheeting), to cover frames extensively, was as follows: To one quart of linseed oil add one ounce of pulverized sugar of lead, and four ounces of pulverized rosin. Heat in an iron kettle until thoroughly dissolved and mixed. Apply while hot to the muslin stretched upon a frame. Mr. Root said: "Endeavor to apply when two successive clear days can be had, to dry it well before placing it over the vapor and heat of a bed." Rings were sewed to the edges of the muslin, fifteen inches apart, to hook over small nails driven into the frame.

Rabbits and Young Trees.—W. H. Carpenter, Livingston Co., Mo., writes us that he is obliged to wrap the trunks of all young fruit trees with some material to prevent the attacks of rabbits, and asks how it would answer to use paper saturated with coal-tar. We would not advise the use of coal-tar in contact with the bark of young trees, as it is sometimes injurious. The old method was to shoot one of the rabbits, cut it open, and rub the trees with its flesh. This led to the use of blood, which in some localities is a common application, and an effective one. Blood is procured from a slaughter-house, and sprinkled on the trees with a swab, made by tying corn-husks to a stick. Rabbits have a great dislike to the odor of blood and flesh, and any method that will apply these to the trees easily and cheaply, may be adopted.

Agricultural Colleges.—G. E. Teeple, Summit Co., Ohio, asks us: "What is your opinion of sending boys to Agricultural Colleges in order to become practical farmers?"—In our opinion the result will depend somewhat upon the college, and more upon the boy. In some States, the college fund has been given to institutions which do not teach the operations of agriculture, and do not provide for, or require manual labor. Some of these are most excellent institutions, but whatever else a boy may learn at them, he must go elsewhere to be taught to be a "practical farmer." Frequently a farmer's boy goes to an Agricultural College for the express purpose of learning those things which will enable him to gain his livelihood in some other occupation than that of his father. This is not the fault of the college but of the student. There are a number of Agricultural Colleges which teach not only the principles of agriculture, but its mechanical operations, and at which a boy can become a "practical farmer" if he really so desires.

Western Editorial Notes.

Rapid Growth of Dakota Towns.

In the Nov. number of the *American Agriculturist*, of last year, we described the rapid growth of Dakota towns, through which we had passed while going through the centre of the Territory, over the Chicago & Northwestern Railroad to the Missouri River at Pierre. We, at the same time, described the land fever then prevailing, which was equal to the gold craze in California, or the oil fever in Pennsylvania. We then journeyed westward from Tracy through Huron and Wolsey. This year we proceeded further north to Minneapolis, then from Minneapolis journeyed nearly due west to Aberdeen, and then southward through Dakota over the Milwaukee and St. Paul Railroad. While the furore for purchasing or locating lands, has materially subsided, we have found towns on this route southward, whose growth has been as marvellous as those we last year visited while going westward through the territory.

Aberdeen, located nearly three years ago last June, now has a population of three thousand; one Presbyterian church, one Methodist, and one Catholic, are built, while a Baptist church is being erected. Many of the people are from the Eastern States, and came here to build up what they believed would be a very large place in the centre of a great agricultural region.

Warner, ten miles south of Aberdeen, has twenty houses, and two large elevators. Stretching out in every direction, as far as the eye can reach, the prairie is dotted with white houses. There is considerable farm machinery lying around the depot at Warner, which should be housed by the owners. A good deal of the prairie is also broken in the neighborhood of the depot. Proceeding south from Warner, we strike an unbroken prairie though little or no government land remains untaken in this vicinity.

Melette.—Reaching Melette, twelve miles south of Warner, we find a village of about thirty houses. There is a large frame elevator near the depot. The country is level hereabouts, and several buildings are going up. Here, as at Warner, there is a good deal of farm machinery lying carelessly about the depot. Far away in the distance, at the right, the dim outline of two or three villages is seen, while the James River appears at the left. Here, as at Warner and Aberdeen, the settlers state that they have had good crops.

Ashton.—Proceeding eleven miles further south to Ashton, we find a village three years old, of about five hundred population, and forty houses. The people hereabouts are mainly from Iowa and Wisconsin. There is a Methodist church built, and another church being erected. One elevator is built, and another is being constructed. There is likewise an artesian well near the depot. The James River flows not far from the village.

Redfield.—Nine miles further south we reach Redfield, situated on a broad plateau of land; there is a large depot here, and a flourishing village of over one thousand population. New buildings are going up rapidly, and the town is booming. In the October *American Agriculturist* there is an error, so far as this town is concerned; instead of saying railroads one hundred miles off, somebody omitted the word lands; that is, railroad lands one hundred miles off. The Chicago and North Western Railroad crosses the Milwaukee and St. Paul Railroad here, so that there are two railroads in the village. Hard wheat is selling here at sixty cents; soft wheat fifty cents a bushel.

Wolsey.—Passing through the hamlets of Tulare and Bonilla, we reach Wolsey, twelve miles south of Aberdeen. This thriving village, which was founded only a year ago this autumn, now has a population of four hundred. The people are mostly from Michigan, Wisconsin, New York, Indiana, Vermont, and some from Missouri. There is one Methodist church built; Catholic and Presbyterian church buildings are being erected. A branch of the Chicago and North Western Railroad crosses the Milwaukee and St. Paul here. There are two grain elevators and two coal sheds near the depot. The prairie is rolling and unbroken for miles in every direction around Wolsey. Hall storms last July cut down the crops in this vicinity. There is a fine school-house on the hill at the left of the railroad near Wolsey. South of Wolsey, wheat and corn were badly cut down last July. We have seen many prairie chickens flying on both sides of the railroad from Aberdeen down to Wolsey.

Alpena.—Continuing our journey southward from Wolsey, we pass through Virgel and reach Alpena. Alpena has two dozen houses, a big school building, a business street, and two handsome buildings being erected by the railroad. The land is rolling, with hills in the distance.

Woonsocket.—Coming still further south ten miles, we reach Woonsocket, which is twenty-seven miles south of Wolsey. Here another branch of the

Milwaukee and St. Paul Railroad coming due east from La Crosse intercepts the division of the same railroad, passing from Aberdeen southward to Mitchell. Woonsocket was only laid out October, 1883, but now there is a population of six hundred people, three banks, two newspapers, and three handsome looking blocks. There are two churches—one Methodist built, and one Presbyterian under way. The brick building in Main street presents a fine appearance. The place, altogether, looks very thrifty and enterprising.

Mitchell.—Twenty-seven miles further south, we reach the flourishing village of Mitchell, where the road coming from the north intercepts the branch of the Milwaukee and St. Paul, running nearly due west through Prairie du Chien, to the Missouri River at Chamberlain. Mitchell is settled with people from Iowa, Wisconsin, Michigan and Illinois. It has six churches, three banks, two hotels, and about four thousand population. There is one daily paper here, and three weeklies. On a hill overlooking the village, the Methodists are now erecting a large university. The City of Mitchell gave the land, and the railroad ran the tracks from the main line up to the plateau on which the university is erected, for transporting building supplies. It also gave the quarry stone for the erection of the buildings, which are to be very fine. Mitchell is named after the president of the Milwaukee and St. Paul Railroad. Turning now due east, towards Iowa, we pass through a rolling unbroken prairie, crossing the James River, which is invariably called the Jim River by the settlers.

Parker, fifty-one miles east of Mitchell, has an oldish appearance. Woods and fences now beginning to appear as we move eastward towards the Iowa boundary. A few miles further, and we have passed from Dakota Territory into Western Iowa. D. W. J.

Free Information about the Great West.

The following have signified their willingness to give any desired information about lands in their respective localities. Their letters were received too late to have the particulars incorporated in the complete tables, published on pages 476 and 477 of the Supplement to the October number:

J. H. Bennett, Pueblo, Pueblo County, Colorado.
J. A. Tresslar, Bluff Creek, Johnson County, Indiana.
P. C. Jacobs, Bluff Creek, Johnson County, Indiana.
John Miller, Bluff Creek, Johnson County, Indiana.
O. H. Tresslar, Bluff Creek, Johnson County, Indiana.
W. H. Paddock, Smith's Valley, Johnson County, Ind.
A. D. States, Cherokee, Crawford County, Kansas.
J. M. Clatchy & Co., Sacramento, Sacramento Co., Cal.
N. R. Burnett, Atalissa, Muscatine County, Iowa.
J. Y. Spangler, New Bedford, Bureau County, Illinois.
John F. Wallace, Bismarck, Burleigh County, Dakota.

Catalogues Acknowledged.

NURSERYMEN.

H. S. ANDERSON, Union Springs, N. Y.—General list, with several new strawberries and other small fruits. Colored plate of Duchsap grape.

ELLWANGER & BARRY, Rochester, N. Y.—A catalogue of small fruits, one of bulbous flower roots, and a supplementary list of novelties and specialties.

GREEN & CO., Rochester, N. Y.—General assortment with small fruits a specialty; all the novelties.

W. F. HEIKES, Huntsville, Ala.—Wholesale nurseries. Oriental pears a specialty.

JOEL HORNER & SON, Merchantville, N. J.—Small fruits and grape vines, new varieties. They sensibly offer the *American Agriculturist* as a premium to purchasers of their stock.

J. T. LOVETT, Little Silver, N. J.—General autumn catalogue, with special sheets describing the Hansell raspberry and Parry strawberry.

JOHN R. & A. MURDOCH, Pittsburgh, Pa.—General nursery list, and a separate bulb catalogue.

RANDOLPH PETERS, Wilmington, Del.—An immense stock. Peaches, a specialty, are divided by periods of ripening into sixteen groups.

JOHN PERKINS, Moorestown, N. J.—Very full in fruit and ornamental departments, with several novelties.

JOHN SAUL, Washington, D. C.—Wholesale list of fruit and ornamental trees, greenhouse stock, roses, etc.

SEEDSMEN AND FLORISTS.

BENSON, MAULE & Co., Philadelphia, Pa., in a note say: "We think our seed catalogue superior to any we have issued, and equal to that of any other establishment." We think so too.

J. A. EVERITT & Co., Watstown, Pa.—"A Revolution in Wheat Growing," advocates the "Martin Amber," and gives useful directions.

D. M. FERRY & Co., Detroit, Mich.—Catalogue of bulbs and seeds for fall planting, including winter wheats.

PETER HENDERSON & Co., Nos. 35-37 Cortlandt St., N. Y. City.—Special strawberry catalogue with colored plate of the "Henderson," and an illustrated bulb catalogue.

MACHINERY, LIVE STOCK, & MISCELLANEOUS.

F. H. BRITT, Ridgeway, N. Y.—Description of his improved Cleshire pigs.

DANA WINDMILL COMPANY, Fairhaven, Mass.—Descriptive catalogue of the Dana Centrifugal Governor Windmill.

EASTERN MANUFACTURING Co., Philadelphia, Pa.—Description of the Granger Fruit Evaporator.

JAMES GARDINER, Mantua, N. J.—Improved Portable Scalding Trough, which may also be used for steaming food for stock.

GOODILL COMPANY, Antrim, N. H.—Peach, Apple, and Potato Parsers, Cherry Stoners, Hammock Chairs, etc.

HEEBNER & SONS, Lansdale, Pa.—Level Tread Horse Powers, Threshers, Drag Saws, and other Farm Machines.

KING & COMPANY, Owego, N. Y.—Describe and illustrate their hand-made barness.

R. L. ORR & Co., Pittsburg, Pa.—"Standard" Feed Mills, "Ajax" Wood-horning Machine, and others.

POWELL & DOUGLAS, Waukegan, Ill.—Illustrated catalogue of Hunting, Fishing, and Pleasure Boats.

SALEM IRON WORKS, Salem, N. C.—Describe and illustrate Hege's Improved Circular Sawmills.

L. B. SILVER, Cleveland, Ohio.—Improved Chester Hogs, with letters from purchasers.

STEDMAN & Co., Aurora, Ind.—Steam Engines, Hay and Cotton Presses, Sawmills, etc.

J. E. STEVENS & Co., Chicopee Falls, Mass.—Stevens' Bicycle Rifle, etc.

WILLIAMS, CLARK & Co., No. 101 Pearl St., N. Y. City.—High Grade Bone Fertilizers.

SEWING MACHINES GIVEN AWAY.—We are informed that good two-thread sewing machines, taken from private families as part payment for the Willcox & Gibbs Automatic, are being given away by the Company to needy and deserving women furnishing satisfactory references. If required to pack or repair, they charge a small sum to cover expenses. Persons desiring further particulars should write to the Willcox & Gibbs S. M. Co., 658 Broadway, New York City.

Cautions to Dairywomen.

Ask for Wells, Richardson & Co.'s Improved Butter Color, and take no other. Beware of all imitations, add of all other oil colors, for every other one is liable to become rancid and spoil the butter into which it is put. If you cannot get it write to us at Burlington, Vt., to know where and how to get it without extra expense. Thousands of tests have been made, and they always prove it the best.

Big Giant Sheller Attachment

This is THE ONLY MACHINE IN EXISTENCE THAT WILL SHELL AND GRIND THE CORN AND SIFT THE MEAL in one operation, MAKING GOOD FAMILY MEAL. It also grinds corn and cob, and small grain. The Sheller can be removed and a Feed Cutter put in its place, and Hay, Straw, or Corn Stalks can be cut for feed. Don't fail to send for price and descriptive circular to the manufacturers of Big Giant Feed Mills.

J. A. FIELD & CO.
St. Louis, Mo., U.S.A.**HEEBNER'S PATENT**

Level Tread Horse Power WITH SPEED REGULATOR.

Heebner's Improved Little Giant Threshing Machine.

No other Power is as powerful and easy for the horses. The Level Lags and Speed Regulator are the most valuable improvements ever made in horse powers. See that you get Heebner's, any other with level lags will be an infringement upon our patents.

The Little Giant has more good points than any other Thresher. None can do work as fast, nor any better, and none are better made. Union Feed Cutter, Drag and Circular Saws, etc. Send for Illustrated Catalogue.

THE LIGHTNING HAY KNIFE

IS THE
**BEST
KNIFE IN THE WORLD!**

To Cut HAY & STRAW from the Mow, Stack, or Bundle.
To Cut CORN STALKS or BALED HAY, or Unthreshed OATS in bundles, into Fine Feed.
To Cut ENSILAGE from Silos. To cut PEAT, and Ditching in Bogs and Meadows, severing grass roots, and cutting off bush roots an inch through, readily. Farmers having any of this work to do, should not be without a Lightning Hay Knife, and would not, after an hour's trial. If you feed only a horse or cow, it will PAY YOU to have a Lightning Hay Knife, to cut fresh hay from the side of the mow or stack, instead of pitching from the top, where it is drying up and losing its best qualities. IT PAYS to use a Lightning Hay Knife to cut a load of Clingy Clover Hay into sections, so as to pitch off easily. This is THE KNIFE which cuts Frozen Hay readily. Manufactured only by
HIRAM HOLT & CO., Me., U.S.A.

A. A. MARKS,
691 Broadway, New York City.

For choice reading, beauty of illustration and typography, and pure and high character, "ARTHUR'S ILLUSTRATED HOME MAGAZINE" has no rival. Established over thirty years ago by T. S. ARTHUR, who still remains its editor, it has always been a welcome visitor in thousands of American homes. Younger and fresher talent unite with the editor's maturer judgment in keeping the Magazine always up to the advancing tastes and social culture of the times.

A SAFE MAGAZINE. The pages of the Home Magazine are kept absolutely free from everything that can deprave the taste and lower the moral sentiment. It is, therefore, a pure and safe magazine. It aims to promote happiness in the family through the cultivation of a spirit of kindness, service, and self-forgetfulness.

Terms, \$2.00 A YEAR; three copies, \$5.00; eight copies and one extra, \$12.00. Specimen numbers free.

T. S. ARTHUR & SON,
920 Walnut St., Philadelphia.

Was constructed expressly to obviate the debilitating effects of ordinary Corsets, by relieving the delicate and vital female organs of injurious pressure, thereby affording such perfect ease and freedom of action in stooping and reclining positions as to leave the Wearer almost unconscious of the presence of a Corset. By its use the weight of the clothes is transferred to the shoulders and chest-walls, that were designed by nature to bear it, giving necessary relief and healthful support. It has beautifully formed busts that give the outlines of perfect development and graceful figure. Ask your merchant for it.

Sample sent prepaid on receipt of \$1.50 and size.

J. G. FITZPATRICK & CO., W.F'GS, NEW YORK.

Illus. Price List free to any address.

Soap and Music.

A concern in Massachusetts wants agents to peddle its Recipe for Making Soap. As an inducement, after the agent has sent the concern orders to the amount of fifty or seventy-five dollars, said agent can have a "Cabinet Parlor Organ." If that organ blows as loudly as do these soap circulars, what a noise it will make!

A Very Ancient Contrivance.

The very worst forms of medical quackery are those that relate to troubles which can not, with propriety, be discussed in a family paper. Some of the circulars of these quacks are most pernicious in the manner in which they act upon the fears of those who may read them. Others contain the most absurd claims, and are fit subjects for ridicule. One of these, now before us, sets forth the merits of its peculiar erinkum, and claims that "discoveries made on mummies in old tombs," show that this "very appliance (only not so crude), was in use by the ancient Egyptians!" Moreover the talk in the circular about the electrical action of the affair in question is most laughable in its absurdity.

"The Great American Propaganda Society."

One, from the name given above, would never guess the objects of the "Society." The "Propaganda" is the name of a Papal Society at Rome, for propagating the Romish faith. To use it for a secret society of Invention, or a sort of Extended Patent Agency, seems ridiculous. A subscriber in sending us its pamphlet, circular, form of oath, and all the rest, asks us: "What do you think of it? Is it square?"—It looks upon the face of it as a scheme for making money out of the patent business. We think no good can come of joining a concern bound together by such oaths as are here printed. At the bottom of the form of oath are several questions, to be answered in writing by the applicant for membership. Among these we find the following: "Question. Do you think any person should live, who will voluntarily take the above obligations, and then violate them?"—If this is not an intimation, that any one who violated the oath should not live, then what does it mean? We do not think that the country is quite ready for this "Secret Order of the Great American Propaganda Societies, with its headquarters at Cincinnati."

The New York Book Company.

The advertisements in papers published at a distance from the city implied, that the "New York Book Company," No. 83 Nassau street, would supply books of a kind the sale of which is forbidden by law. The "Company" had long been under suspicion, but the officers in their visits to the place in Nassau street could find no evidence of traffic in improper literature. It was at length discovered, that the "Company" had an "annex" on South Washington Square, where a stock of contraband books was kept, and where the books of this character were mailed. The law forbids the use of the mails for sending such books, and Anthony Comstock, as special agent of the Post Office Department, arrested Wm. Moore and Isaac Wallenstein, who made up the "Company," and took them before a U. S. Commissioner.

A CHANGE OF ADDRESS.

Those who may have occasion to write to the young men doing business under the high sounding title of "New York Book Company," will be more likely to reach them if they address their letters to Ludlow street Jail, instead of 83 Nassau street. The Grand Jury recently indicted them for violating the law against sending indecent books, etc., by mail, and they are in that celebrated retreat, Ludlow street jail, awaiting trial.

He Wants Particulars.

D. A. Mount, Middlesex Co., N. J., writes us, that a friend received a free Recipe for the Cure of Catarrh and Bronchitis, from a so-called Dr. Lawrence in Brooklyn, N. Y. After trying to get the prescription prepared at the drug stores, and failing, his friend proposed to

send the money to Lawrence himself for the stuff. Mr. Mount advised his friend to keep her money until she could learn something about said Lawrence, and he asks us "to give the particulars" in the *American Agriculturist*. We only know this Lawrence by his publications, and these proclaim him to be a quack. It is the old dodge of offering a free recipe, and sending a pretended prescription that calls for articles that have no existence. There is always a saving clause in the circulars of these chaps. They foresee that there may be a difficulty in finding the articles called for by the recipe, and offer to furnish the compound at a round price. This Lawrence sends two recipes, one of which contains "Acetate Silica," an article that has no existence. The other recipe calls for the "Compound Tincture of Arabian Red Lava Flower," a thing which Lawrence was sure that no apothecary would be able to supply. When one sends recipes, which he knows can not be prepared, is he anything but a fraud, and a very mean one? Mr. Mount should advise his friend to save her money. One who is false in one thing is likely to be false in all.

Corresponding With Strangers.

No young girl should engage in a correspondence which she is unwilling that her mother should know about. No good can come from corresponding with a stranger, and much evil may follow. It is not rare to see advertisements for a wife or for a husband. These, usually by persons well advanced in life, are sufficiently disgusting, but when young girls of sixteen or eighteen, advertise for correspondents of the opposite sex, with a view to matrimony, it is revolting to all right feeling persons. A paper published in Chicago, devoted to matrimonial matters, has two pages filled with advertisements of those of both sexes, who wish correspondents, a most melancholy display. Many of the advertisements are most thoughtless, and show that the girls have no idea of the importance of the subject they approach with so much frivolity. One girl writes: "A Blooming Miss, of 'sweet sixteen,' with long black hair and blue eyes, wishes to correspond with an unlimited number of gents. Object, mutual improvement, and may be—." Will reply to all who enclose stamp or photo." There is plainly room for "improvement," for any girl who speaks of gentlemen as "gents," but why "an unlimited number?" Another reads: "Two young school girls, cultured and refined, both brunettes, would like a few gentlemen correspondents. Emma is sixteen, and Geneva nineteen." The appearance of that advertisement shows that people may have very different ideas about "refinement." The whole thing is wrong, it has not a single redeeming feature, and it is melancholy to think that there are so many young girls, as this paper shows, who are lacking in that modesty and that nice sense of propriety, which should be the crowning graces of girlhood.

Clairvoyants, Sybils, and the Like.

The papers in all large cities, that will publish them, contain advertisements of persons who claim to possess clairvoyant powers, or to be remarkably gifted beyond ordinary mortals. They advertise to hold "consultations," or "seances," upon business, matrimony, sickness, to aid in the recovery of lost or stolen articles, etc. One who reads these advertisements, may wonder that there should be people so foolish as to consult the advertisers, without suspecting that their innocent looking cards cover far more than appears on the surface, and may lead to the most diabolical transactions.

THE COUNTESS DEL VASTO.

Notwithstanding she claimed to be a Countess, the officers of "The Society for the Suppression of Vice," recently arrested a female, who has operated under a variety of names and titles. She has at times been a teacher of languages, a professional beautifier, a matrimonial agent, etc. Lately as the Countess del Vasto, she claimed to be a "Roman Sybil." Her circular setting forth the various branches of her business, is a remarkable production. She claims to possess supernatural powers, and to be able to serve her patrons "at any time, in any way, and in any kind of trouble." This would seem to be comprehensive enough, but she specifies matrimony, stock speculations, the healing art, and the art of beautifying, as among the things to which she gives special attention. A part of her business was dealing in "rare photographs," which proved to be pictures hardly suited for parlor decoration. One of her methods of forming acquaintances was to answer the advertisements of those in search of furnished lodgings. After all, her real business was that of a procuress, and the charge upon which she was arrested is that of leading little girls to their ruin. The details of this horrible case would be out of place here, but the evidence appears to show her to be a vile monster in female form, and should convict her of a crime, for which, unfortunately, the law does not provide an adequate punishment.

OVER FIVE HUNDRED LETTERS.

When the creature was arrested, over five hundred letters were seized, which fully reveal the nature and extent of her crime. Some of these letters, it is said, are signed by men well known in business and other circles, who have heretofore been regarded as respectable. The creature, since her arrest, has threatened to expose certain wealthy persons, who have had "business relations" with her, unless they come to her relief. The whole crew of clairvoyants are frauds, and some of them use the business as a cloak to cover the vilest occupations.

The Interior Associated Press.

The circular or prospectus of the "Interior Associated Press" is rich reading. It intends to have a circulation of one million for the "Farmer's Ledger." To this end it proposes to have a "local edition" of the paper in every county, until the million is reached, when outsiders must stay out. The plan is for a person in each county to proclaim himself Publisher and Editor, get all the subscriptions and advertising he can, and forward his orders with money to headquarters. His papers will be forwarded to him all printed and properly edited with local news to suit his particular meridian.

PUBLISHING MADE EASY.

This "Association" shows how any one, no matter what his previous experience may have been, can at once bloom out as editor and publisher. This he can do with no cost to himself, and make much money besides. What a pity the rest of us had not had this chance years ago. "Young man," said the old man to a beginner, "the most compendious way to make money, is to buy goods very low on a long credit, and to sell them very high for cash." That is a poor way of money making compared with the plan of this "Interior" concern, which requires no capital at all, while the profits are large—besides the "passes." A strong inducement to enter the business of publishing is the passes on railroads, to circuses, and other shows, which the local publisher and editor is to enjoy, and full directions as to "How and where to apply for passes" are given, as apparently the most important of an editor's labors. Each local edition of the "Farmer's Ledger" stands a chance of being unlike all other editions, as the paper will be furnished to each publisher "Democratic, Republican, Greenback, Prohibition, Agricultural, Literary, in short any style of paper." Being a "Farmer's Ledger," one would suppose that the paper might be slightly "agricultural," without detriment. But the "Ledger" can be "all things to all men;" so long as the money is paid, the "Interior Associated Press" says, "you takes your choice." This grand scheme has its headquarters at—where else should it be—Cincinnati. But "as soon as the necessary machines can be completed, we will open offices in New York, Boston, New Orleans, and St. Louis." Pray hurry up that machinery, and not confine all the fun to Cincinnati.

HOW IS IT WITH OLD SCHEMES?

This "Interior" scheme reminds us of "The American News Exchange," and the "Mutual Press Association," also of Cincinnati, which two or three years ago were such "promising" concerns, but of which, of late, we hear nothing. Is the "Interior Associated Press" an outgrowth of these, or is it a rival shop?

A. 15 A.

We have never before extended this liberal proposition. There are, however, so many requests from new subscribers for our Premium List, which is a supplement to our October number, that we have decided to extend the terms of our liberal offer to subscribers, which is as follows: Every new subscriber, English or German, for 1885, whose subscription is received at this office before December 1st, can have the October, November, and December numbers of this year, 1884, free.

This extension of course entails much additional expense upon us. We have to-day, for example, again put the forms of the *American Agriculturist* upon the press, and are striking off a heavy additional edition to meet the wishes of the new subscribers who want the October number, as well as the November and December of this year. Canvassers, Club Raisers, and those who are working for Premiums, ought to be able to readily induce people to subscribe, when the remainder of this year is given free to all new subscribers.

Our * Great * Special * Present.

NOW READY.

It is not Chambers' Cyclopædia, Price, - - \$25.00
 It is not Johnson's Cyclopædia, Price, - - \$42.00
 It is not Appleton's Cyclopædia, Price, - - \$80.00
 It is not the Encyclopædia Britannica, Price - \$125.00

BUT THE

AMERICAN AGRICULTURIST FAMILY CYCLOPÆDIA.

With over 700 Pages, 1,000 Engravings, and an Agricultural Supplement by the Editor-in-chief of this paper for nearly a quarter of a century, which is PRESENTED to every Subscriber, at \$1.65, (English or German, old and new), to the American Agriculturist for 1885. More convenient for every-day practical purposes, than any one of the above expensive works. For full particulars see third cover page.

All explanations regarding the Postal Card Album Scheme only serve to render still more apparent the hypocrisy and treachery of the author. Anything which may now be said in extenuation, will not change the opinion of the newspaper press which declared itself so emphatically at the time the request to print the item was sent to Editors all over the country. One of them wrote us wishing to know if the "Postal Card Album Scheme was not a fraud," and requesting us to "give it a blast in our Sundry Humbugs." Another asked, "is this a square deal with you." A third wrote, "that the dodge was too thin." A fourth, "it looks like a bid for names, and is a beautiful trick." A fifth, "we certainly have only a common interest in 'scotching' such aims." A sixth asked, "if the whole thing was not an attempt to appropriate the subscribers of the *American Agriculturist*?"

While the scheme was then thus regarded by contemporaries, they may now infer that it covered still another purpose, upon learning that on the 8th of January last, the officers of this Company, in a written communication, demanded that any lists of our subscribers surreptitiously secured, should be turned into this office within thirty-six hours. They have not yet arrived.

We do not now care to refer to the persistent but futile efforts made prior to that time to use the columns of the *American Agriculturist* for floating Sackett Plow and other personal schemes.

Will all subscribers receiving an extra October number, please give it to some friend or neighbor, who may be induced to become a subscriber?

Specimen copies of the *American Agriculturist* and special inducements forwarded to canvassers.

The Return of Joseph Harris.

When, after an intermission of several years, Mr. Joseph Harris resumed his connection with the *American Agriculturist*, and became one of our active editors last summer, the announcement was received with lively satisfaction wherever the *American Agriculturist* is read. Subscribers of former years who, for one reason or another had ceased to take the paper, but have now renewed their subscriptions because Mr. Harris has become one of the editors, express themselves in the warmest terms at the wonderful improvements made in the *American Agriculturist* since they were subscribers before. We propose to make the *American Agriculturist* still more valuable and attractive than it has been since last June, when, freed from all incumbrances, it entered upon a new career. Having relieved the Company from a very heavy load of debt, which they found saddled upon it when taking control some years ago, the present managers now have every facility in their power and no obstacles to prevent them from carrying out the largest plans for the future development and usefulness of the *American Agriculturist*. We aim to make this Journal, as in the past, the recognized leading agricultural authority of the world.

Our Advertising Patronage.

The remarkable display presented by our advertising columns during the recent period of depression is a marvel to other journals. The secret of this success is due not only to the large circulation of the *American Agriculturist*, but to the fact that we exclude from our columns all advertisements of a doubtful character. During the past year advertisements amounting to over \$50,000 have been declined because we could not safely endorse the advertisers. We shall in the future adhere to the same restrictive policy.

Our Great Cyclopædia Offer.

Though at this writing it has been only four days since we began to deliver the FAMILY CYCLOPEDIA, which is presented to all subscribers of the *American Agriculturist*, old and new, for 1885, who immediately send us \$1.65, we are receiving gratifying responses from those who have received the volume. Here are some of them:

GRANTSVILLE, Md., Oct. 9, 1884.
 A very good book; quite useful both for old and young.
 SAM'L. BEACHY.

MIDDLEBUSH, N. J., Oct. 7, 1884.
 Cyclopædia gratefully received. Am well pleased with it.
 JACOB RYCHOFF, JR.

WALTHAM, MASS., Oct. 7, 1884.
 The Cyclopædia came duly to hand; consider it well worth the price.
 EDW. R. HASTINGS.

DOBBS FERRY, N. Y., Oct. 7, 1884.
 The Cyclopædia has come to hand all safe. A very handy book to have in the house.
 JOHN DUTCHER.

SCRANTON, Pa., Oct. 7, 1884.
 The Family Cyclopædia received. I am well pleased with it.
 R. A. WILLIAMS.

INDIANA, Pa., Oct. 7, 1884.
 Am well pleased with the Cyclopædia, and think it a model book of reference.
 JACOB A. HILE.

LEOMINSTER, Mass., Oct. 6, 1884.
 Book received to-night; much pleased with it.
 MRS. C. F. CONANT.

EASTON, Pa., Oct. 6, 1884.
 Cyclopædia to hand this morning. I am well pleased; accept my thanks.
 D. L. BIXLER.

CAMDEN, N. J., Oct. 6, 1884.
 Cyclopædia received, for which accept many thanks; it is highly appreciated.
 SAM'L. WILLS.

LEBANON, Pa., Oct. 6, 1884.
 Cyclopædia received: am delighted with it; it ought to be in every family and home.
 HENRY S. HEILMAN.

BELL PORT, N. Y., Oct. 6, 1884.
 Have this day received the Cyclopædia, and find it a very nice work, and think every family should try to obtain a copy.
 I. J. RAVEN.

GREENVILLE, Del., Oct. 6, 1884.
 We each received the Cyclopædia; are very much pleased with it; thanks.

WM. WILSON and R. LEITHEAD.
 SOMERVILLE, N. J., Oct. 6, 1884.
 Received your Cyclopædia this morning; many thanks for the same. I think it will be very handy and instructive.
 THEODORE F. CORNELL.

BIRMINGHAM, Conn., Oct. 7, 1884.
 The Cyclopædia came safe yesterday, and it is certainly a very useful book for our family. I am well pleased with it.
 S. G. SCOTT.

PHILADELPHIA, Pa., Oct. 7, 1884.
 Cyclopædia came to hand safe, many thanks; it appears to be a very complete book. Wishing you much success for the year 1885, etc.,
 EDWARD KLINE.

DEEP RIVER, Conn., Oct. 6, 1884.
 Have received the two Cyclopædias. A very nice book. One was for a neighbor; he says it is a grand gift, and he will have more than his money's worth.

MRS. H. T. READ.
 KATONAH, N. Y., Oct. 8, 1884.
 I have taken the *American Agriculturist* for twenty-five years, and have never missed a number. I feel that I can not do without it. The Cyclopædia looks good.
 JOSEPH W. ANDERSON.

CHADWICKS, Oneida Co., N. Y., Oct. 7, 1884.
 I received your Cyclopædia to-day, and am very much pleased with it; it is something I have been looking for. I will distribute the circulars among my friends.
 CHAS. W. COOKINHAM.

HINGHAM, Mass., Oct. 8, 1884.
 I have received the Cyclopædia, and would say, that I am agreeably surprised at the reception of such an attractive looking volume, for I did not suppose as a gift it could be any more pretentious than a pamphlet.
 HENRY W. CUSHING.

WEST CHESTER, Pa., Oct. 6, 1884.
 We are in receipt of the Cyclopædia, and are surprised at the careful and complete manner in which it is printed and compiled. It certainly will prove very useful in every home.
 HOOPES BRO. & THOMAS.

W * H * Y

The American Agriculturist is better now than ever before.

First:—The *American Agriculturist* has been enlarged and vastly improved in all its various departments. It is now printed on super-calendered tinted paper with a glaze and finish which give clearness and distinctness to the type and illustrations.

Second:—In addition to the old staff of Editors and life-long contributors who have aided in making the Journal what it is to-day, new names have been added to our Editorial force, which will be still further strengthened with fresh acquisitions.

Third:—Joseph Harris, the founder of the "Genesec Farmer," author of "Walks and Talks on the Farm," etc., and whose agricultural writings have made him famous on both continents, has become one of the active Editors of the *American Agriculturist*.

Fourth:—The very note-worthy improvements made in the *American Agriculturist* since June last, embrace a complete transformation in the character of the illustrations. New and talented Artists have been employed, until the engravings and illustrations in the *American Agriculturist* have become, during the past four months, more numerous and far superior to those appearing in any similar publication. The *American Agriculturist* has for years been the recognized authority in all matters pertaining to agriculture; it has now, this year, become the first **Illustrated** Agricultural Journal of the world.

Fifth:—New methods and new agents for mailing have been employed, so that the *American Agriculturist* leaves the office as regularly as clock-work, and if any number fails to reach the subscriber, our new plan for discovery immediately makes known the cause.

Sixth:—The premium articles offered this year have been selected conjointly by the Editors and Publishers, to specially meet the wants of our great army of subscribers. While the list comprises very many new articles, those which have proved specially popular and desirable in the past are retained; all of them have been secured at great bargains, of which our subscribers get the benefit.

Seventh:—Every subscriber to the *American Agriculturist*, new or old, whose subscription for 1885 is forwarded immediately to us, together with \$1.65, is entitled to the **New American Agriculturist Family Cyclopædia**, fully described on third cover page.

Eighth:—All former, or new subscribers, whose subscriptions and money are received before October 30th, will receive the October, November, and December numbers of this year free. Subscribe immediately.

50,000 Wanted.

Men, women and children, to canvass during the next few weeks for the *American Agriculturist*. Everybody who sees a copy of the paper, and the **FAMILY CYCLOPEDIA**, which is presented with it, ought to be induced to subscribe without much talk or labor.

Our Great Premium List.

From every quarter we have received the most complimentary notices of our very handsome Premium List issued as a Supplement to the October *American Agriculturist*. Hardly forty-eight hours elapsed from the mailing of this premium list, before we began to receive orders for numerous articles among the very many offered. Our readers can rely upon their being just as represented. Please write us if any particulars are desired about

any of the premiums. Furthermore, we shall be glad to ascertain for any inquirer the cost of freight or expressage on any article in the list which is not pre-paid.

The German American Agriculturist.

Have you any German neighbors? Have you any German gardeners or German workmen of any class in your employ? You cannot furnish them with more interesting and valuable reading matter than is contained in the columns of the *German American Agriculturist*. On landing here from the fatherland, the first money the German emigrant spends after paying his railroad fare, should be for a year's subscription to the *German American Agriculturist*. It aims to make them acquainted and familiar with the soil, and the best modes of farming and gardening in the new world to which they have come. Price, post-paid, \$1.50 a year.

Our Very Latest Books.

Published, Imported, and sent post-paid on receipt of price.

Cats—Their Points and Classification, with Chapters on Feline Ailments and their Remedies, How to Train for Performing Tricks, etc., by W. Gordon Stables, M. D., etc. Since Cat Shows have become an institution in England and in this country, a cat literature follows as a matter of course. The work, the title of which we have given above, is a 12mo., of nearly five hundred pages, and illustrated by colored engravings of the different breeds. The author, who is a well known authority on Dogs, has brought together a large amount of cat lore, and relates many cat stories in an easy, talky manner. In what may be regarded as the practical portion of the work, is a chapter on "Classification and Points," another on "Tricks and Training," and that which will probably most interest owners of pet cats, one on Feline Ailments. Price, post-paid, \$2.00.

Modern Window Gardening.—Treated under Aspects, North, South, East, and West, by Samuel Wood. The title of this work is rather a misnomer, as about two-thirds of its one hundred and seventy-six pages are devoted to out-door gardening, including the culture of vegetables. Being by an English author, and for the English climate, the work, if followed as a guide in this country, would mislead. If the difference in climate be kept in mind, and proper allowances made for it, the work will be found to contain many useful suggestions, and in its selections of plants is quite up to the time. Price, post-paid, \$1.25.

Your Plants.—Plain and Practical Directions for the Treatment of Tender and Hardy Plants, in the House and in the Garden, by James Sheehan. The Orange Judd Company, New York: The above title well describes the character of the work—"Plain and Practical." The author, a commercial florist and gardener at Geneva, N. Y., has endeavored, in this work, to answer the many questions asked by his customers, as to the proper treatment of plants. The book shows all through, that its author is a practical man, and he writes as one with a large store of experience. The work better meets the wants of the amateur who grows a few plants in the window, or has a small flower garden, than a larger treatise intended for those who cultivate plants upon a more extended scale. The appearance of the work, just as window gardeners are setting their plants in order, is timely, and it will prove to be the book they have been looking for. Paper covers, post-paid, for 40 cents.

Tobacco Culture.—A New and Enlarged Edition. Orange Judd Company, New York: The *American Agriculturist* offered prizes for the best essays on Tobacco Culture, with a view of obtaining an exhaustive treatise for publication in its columns. A large number of essays were received, including many of great value. Fourteen of the number were selected and published in pamphlet form. Another edition is now in press, enlarged by the addition of a chapter on the Manufacture of Tobacco. This chapter was written in answer to the numerous inquiries regarding the conversion of the leaf into its manufactured forms. Price, post-paid, 25 cents.

The Practical Poultry Keeper.—A Complete and Standard Guide to the Management of Poultry, for domestic use, the markets, or exhibition, by Louis Wright. New Edition, with colored plates. The Orange Judd Company, New York: As a rule, an English work upon any rural subject is unsuited to Americans. The book, the full title of which is given above, is a marked exception to the rule. When the work first appeared, it was found to be so practical and altogether so excellent, that the publishers at once arranged to publish an American edition, and it immediately took its place as a standard work on Poultry. Successive editions have been published, and the last, with colored plates of the leading breeds, is more complete as well as more elegant than any of its predecessors. The author treats all that relates to poultry-keeping in a common sense manner, as rare as it is acceptable. If there is a better work on Poultry, we are unable to name it. Price, post-paid, \$2.00.

The Forester.—A Practical Treatise on the Planting, Rearing, and General Management of Forest Trees, by James Brown, LL. D., Inspector of Woods and Forests, Port Elgin, Ont. This is a large 8vo. volume of about nine hundred pages. The fact that a work of this size has reached a fifth edition, indicates to a certain extent that it has real value. The subject is treated in its various branches, and is well illustrated. We are surprised, that at this day an author should classify trees or other plants by the Linnean System. This, however, does not affect the practical character of the work. In the present interest in Forestry in this country, every work of real value is welcome. As the author has had a Canadian experience, the book is more likely to be suited to the United States than one by an author with an exclusively European training. Price, post-paid, \$10.00.

Forest Leaves.—Their Value.—

"The sere and yellow leaf" is here once more, strown in profusion under the shade trees, and in the forests and wood-lots. Leaves are rich in plant food, and will pay well for gathering. They are always a valuable addition to the compost heap, almost indispensable in the hot-bed, and a convenient bedding for pigs and in the stables. If raked up in large heaps before the snow falls, they can be taken in at leisure intervals during the winter as they are wanted. But it is better to have them stored under a shed or out-building, or near the stables. With a suitable box-cart, and large wooden forks made for the purpose, leaves can be gathered quite rapidly. They make a soft, warm bed, promote the comfort and thrift of cattle, and in this way save food. The leaves left in the street, or by the roadside, have an untidy air and go to waste.

The Ives and other Grapes.—

In mentioning in July last that the Ives had uniformly failed with us, we suggested that the experience of one's own locality was the only safe guide in the selection of varieties to plant. Apropos of this, Horace Lloyd, Chester County, Pa., writes us that with him the Ives is a strong grower, an abundant bearer, though he regards it of poor quality, except for wine. He is especially pleased with the Brighton as a vigorous and prolific vine, and he considers the quality as best. We regard the Brighton as destined to be a most popular grape when it is better known. The Hartford Prolific, Mr. Lloyd thinks well of as an early variety. Its chief fault is the dropping of the fruit when ripe. Close pruning and training remedy this, but it is inferior to the Adirondack and Creveling, both of which do well with us in the same vineyard where the Ives persistently fails.

Cream Turning Blue.—

J. H. Hartman, Berks, Pa., asks us: "Why does the cream turn blue on top in arch-cellars?"—Your arch-cellars are not well ventilated. To cure the trouble, there must be a free, though not necessarily strong current of air over the cream and milk, even though the cellar should be several degrees warmer than now. The blue color is from minute mould plants, which are not only on the surface, but penetrate all the upper part of the cream with fine threads. The blue particles are, we may say, only the blossom and fruit of the mould field. The first thing for you to do is to secure ventilation; then dry off the cellar, sweeping the walls, and scraping and sweeping the floor. Scatter dry-slaked lime over the floor, and sweep it about until the floor is white with it; then whitewash the walls and top of the arch-way of the cellar, shelves, supports, racks, etc. This will kill the mould. Then whenever you add fresh cream stir thoroughly all the rest, whether in the same pot or in others, and you will have no more blue-topped cream.

CUTTING FEED.
Fearless Two-horse Power, positively **unequaled** for ease of team and amount of power, and Standard Feed-cutting that gives the most **unbounded** satisfaction. Cutting feed saves money. Economy says it. Fearless Threshers and Cleaners, Clover-hullers, Wood Circular-saw Machines and Fanning-mills, not excelled by any. Buy the best. Catalogue sent free. I. ROOF, Medina, Ohio.**

Prof. Duncan Campbell, M. D., LL.D.,

F. R. S., President Royal College of Physicians and Surgeons, Member General Council University of Edinburgh, &c., &c., says:

"**Liebig Co.'s Coca Beef Tonic** has more than realized my expectations."

PROF. JOHN M. CARNOCHAN, M. D., Surgeon-in-Chief, New York State Hospital, Professor Surgery New York Medical College, ex-Health Officer, Port of New York, &c., says:

"My patients derive marked and decided benefit from the **Liebig Co.'s Coca Beef Tonic.**"

PROF. C. H. WILKINSON, Editor Medical and Surgical Journal, says:

"**The Coca Beef Tonic** of the Liebig Company, combined as it is with Coca, quinine and iron, forms a most valuable adjunct to the practice of medicine. From the experience we have had with it, we are forced to speak in its favor and to recommend its use. Beef, iron and quinine cannot be surpassed by any other three ingredients in or out of the dispensary for invigorating an enfeebled system, and when such remedies can be obtained combined from so reliable a house as Liebig's, it behooves the profession to patronize the same to the fullest extent."

"You have succeeded in placing in our hands one of the most effective of tonics. I cannot conceive of a better combination than the nutritive essence of sound, healthy Beef and Coca, dissolved in a reliable sherry," says:

PROF. F. W. HUNT, M. D., New York, formerly Professor of Materia Medica and Medical Botany, Honorary Member Imperial Medical Society of St. Petersburg, Russia, &c., &c.

Coca Beef Tonic embodies the nutritive elements of the muscular fibre, blood, bone, and brain of carefully selected healthy bullocks. It also embodies the tonic virtues of the Coca or Sacred Life-Plant of the ancient Incas, the two (the Beef and the Coca) being dissolved in a choice quality of sherry wine. It is the most perfect nutritive reconstructive tonic ever offered to the medical profession and public.

"A very strengthening tonic," says

PROF. COLPAERT,—Bulletin Generale de Therapeutique.

Coca Beef Tonic is a purely natural and easily digested tonic for invalids, dyspeptics and all who are run down and debilitated. It is a valuable aid to convalescents. It is in every sense of the word a revitalizer, reconstructor and force generator. It is a boon and a blessing to brain-workers who need a tonic devoid of unpleasant reaction.

The Journal of the Royal Society of Vienna says:

"It is remarkable that the Indians never suffer with consumption, and the cause of it is the use of Coca. They reach a very old age, and frequently pass their full century."

DEDHAM, Me.

TO THE LIEBIG COMPANY:

Gentlemen.—Your agent left me a bottle of your Coca Beef Tonic for me to try. I took it myself, as I had been sick for a number of months with a lung affection and was not able to practice. It helped me very much—so much so that I am now about as well as usual. I have since given it to a number of patients, and it has benefited every case. I am indeed most thankful that it came to my hands. *I had tried different preparations of Coca before, but had no effects from them.* **H. S. PHENIX, M. D.**

Be sure to ask for **Liebig Co.'s Coca Beef Tonic.** Refuse artfully named, inferior preparations. Price One Dollar. N. Y. Depot, 38 Murray street.

Just Published.

Your Plants.—Plain and Practical Directions for the Treatment of Tender and Hardy Plants in the House and in the Garden. By James Sheehan, Practical Florist, Geneva, N. Y. Paper Covers. 40 cts.

The Practical Poultry Keeper.—A Complete and Standard Guide to the Management of Poultry, whether for Domestic Use, the Markets, or Exhibition. New Edition, with colored Plates. By L. Wright. Cloth, 12mo. 2.00

Nearly Ready.

Plant Life on the Farm.—By M. T. Masters, M. D., F.R.S. A sketch of the Physiology or Life History of Plants; of the way in which they are affected by the circumstances under which they exist, and how they in turn react upon other living beings, and upon natural forces. 1.00

Ornamental Gardening for Americans.—A Treatise on Beautifying Homes, Rural Districts, and Cemeteries, by Elias A. Long, Landscape Architect; author of "The Home Florist." Illustrated. Cloth, 12mo. 2.00

Rabbits for Exhibition, Pleasure and Market.—A Complete Guide for the Amateur and Professional Rabbit Keeper. By R. O. Edwards. 1.25

Prairie Experiences in Handling Cattle and Sheep.—By Major W. Shepherd, R. E. With Illustrations and Sketches by the Author.

Nimrod in the North; or, the Hunter in Hyperborean Regions.
BY LIEUTENANT FREDERICK SCHWATKA, M. D.,

Late and Valuable Books.

Practical Forestry.—By ANDREW S. FULLER. A Treatise on the Propagation, Planting, and Cultivation, with a description and the botanical and popular names of all the indigenous trees of the United States, both Evergreen and Deciduous, with notes on a large number of the most valuable Exotic species. Just published. Cloth, 12mo. 1.50

GUNS, ETC.

If you want a good Gun or Rifle, either as a Premium, or at a bargain for Cash, please write us, stating just what is desired. We are prepared to furnish a reputable makes, and at the lowest possible prices. We sell only reliable Firearms, and guarantee all we send out.
ORANGE JUDD CO., DAVID W. JUDD, Pres.
751 Broadway, New York.

Gardening for Young and Old.—By JOSEPH HARRIS, Author of "Walks and Talks on the Farm," "Talks on Manures," etc. Both young and old gardeners will be interested and aided by Mr. Harris's counsels given in this book. Cloth, 12mo. 1.25

Barn Plans and Out-Buildings.—This work is the cheapest for the price ever issued upon the subject of which it treats. It abounds in hints and suggestions, and contains 275 illustrations. Cloth. 1.50

Barry's Fruit Garden.—By P. BARRY. New edition, thoroughly revised by the author. From its first issue, this book has held a place in the front rank as a standard authority upon the subject of which it treats, and the author's long, practical experience, which is here related, makes this work of the highest value. Cloth, 12mo. 2.50

American Cattle.—Their History, Breeding, and Management.—Revised and brought down to the present time by the author. By LEWIS F. ALLEN, ex-President New York Agricultural Society, editor "American Shorthorn Herd Book," author "Rural Architecture," etc., etc. 2.50

Cottage Houses.—By S. B. REED, Author of "House Plans for Everybody." For Village and Country Homes, with complete Plans and Specifications. New edition. Cloth, 12mo. 1.25

House Plans for Everybody.—By S. B. REED. Designs of Dwellings are given, costing from \$250 up to \$8000, with estimates of all articles used in building. Cloth, 12mo. 1.50

Practical Floriculture.—By PETER HENDERSON. The same favor with which Mr. Henderson's two works on Gardening have been everywhere received, has also been accorded to this book. It is thorough, complete, and useful, both to Florists and Amateurs everywhere. Fully Illustrated. Cloth, 12mo. 1.50

New American Farm Book.—Originally by R. L. ALLEN. New revised and enlarged edition by L. F. ALLEN.—The first edition of this work was regarded as the best upon the subjects of which it treated, and the later edition, revised and enlarged, maintains its place in the front rank. Cloth, 12mo. 2.50

The Horse.—How to Buy and Sell.—By PETER HOWDEN. It is often difficult to distinguish real from imaginary defects, and to know what is sound and what unsound in a horse; and this little book will tell one how to do it. Cloth, 12mo. 1.00

The Saddle Horse.—A Complete Guide for Riding and Training. Those who enjoy Horseback-Riding, of whom there is a multitude, can learn from this little book how best to take that exhilarating exercise. Cloth, 12mo. 1.00

The Shepherd's Manual.—By HENRY STEWART. A Practical Treatise on the Sheep, for American Shepherds. New and enlarged edition. Illustrated. Cloth, 12mo. 1.50

Coburn's Swine Husbandry.—By Hon. F. D. COBURN. This most valuable work on the Management of Swine, and Prevention and Treatment of their Diseases, has been thoroughly revised and enlarged by the author in this new edition. Cloth, 12mo. 1.75

An Egg Farm.—By H. H. STODDARD. One of the best and most practical works upon keeping Poultry in large numbers. Illustrated. Cloth. 75 cts.

Quinby's New Bee-Keeping.—By L. C. ROOT. The mysteries of Bee-Keeping explained, with results of fifty years' experience with the latest discoveries and inventions, presented in the most improved methods, forming a complete Guide to successful Bee-Keeping. With one hundred illustrations, and a portrait of M. Quinby. New and revised edition. Cloth. 12mo. 1.50

American Grape Growing and Wine Making.—By GEORGE HUMANN, Napa City, Cal. New and revised edition. No one stands higher as an authority upon Grape Growing and Wine Making than Prof. Humann, and we have here a record of his own experience, and also that of others of high reputation. Illustrated. Cloth. 1.50

Guenon's Treatise on Milch Cows.—A Treatise on the Bovine Species in General. An entirely new translation of the last edition of this popular and instructive book. By THOS. J. HAND, Sec'y of the American Jersey Cattle Club. With over 100 Illustrations, especially engraved for this work. Cloth, 12mo. 1.00.

Household Conveniences.—With over two hundred Engravings. A most useful volume, filled with valuable Hints and Suggestions for doing all kinds of work in the Household. 1.50

Chorlton's Grapegrower's Guide.—Intended especially for the American climate; being a practical Treatise, with Engravings, on the Cultivation of the Grape-vine in each Department of Hot-house, Cold Grapery, etc.; with Plans for the Construction and Heating. By WM. CHORLTON. Illustrated. Cloth, 12mo. .75

FOR SPORTSMEN.

10 Valuable Books Sent FREE!

"Happy Days" is one of the most charming illustrated literary and Family Papers Published. Every number contains 16 mammoth pages, 48 columns of the choicest reading matter, including stories, sketches, poems, useful knowledge, history, biography, wit and humor, prettily illustrated. Wishing to introduce the paper into thousands of homes where it is not already taken, we now make the following extraordinary offer: Upon receipt of **Only Twenty-Five Cents** in postage stamps we will send **Happy Days** on trial for three months, and we will also send free and post-paid, **Ten Valuable Books**, each neatly bound in pamphlet form and printed from large clear type upon good paper, beautifully illustrated and comprising ten complete first-class novels and other works by well-known and popular authors as follows: 1, The Lady of the Lake, by Sir Walter Scott; 2, Grimm's Fairy Stories for the Young; 3, David Hunt, by Mrs. Ann S. Stephens; 4, Rescuing the Whirlwind, by Mary Cecil Hay; 5, Dudley Carleton, by Miss M. E. Braddon; 6, The Mystery of the Headlands, by Etta W. Pierce; 7, A Golden Dawn, by the Author of "Dora Thorn"; 8, Valerie's Fate, by Mrs. Alexander; 9, Sister Rose, by Wilkie Collins; 10, Anne, by Mrs. Henry Wood. Remember, we send all these charming books, ten in number, free to any one sending 25 cents for a three months' trial subscription to **HAPPY DAYS**. The books in cloth-bound form would cost at least \$1 each. This great offer presents an opportunity whereby you may secure a very large amount of the most fascinating reading matter for a very little money. No better investment of the small sum of 25c. could possibly be made. Money refunded to all not satisfied that they receive three times the value of amount sent. Five sets of the ten books and five subscriptions to the paper will be sent for \$1.00. Take advantage of this great offer at once. Address **PUBLISHERS HAPPY DAYS, HARTFORD, CONN.**

DIRK

267

DISCOPHORA

FRICTION-BALLS

352

FRINGE

Dirk, derk. A dagger formerly much used in the Highlands of Scotland, and still worn as essential to complete the Highland costume.

Dirt-eating, dert/et-ing. Cachexia Africana, a disorder of the nutritive functions among negroes, and in certain kinds of disturbance of the feminine health, in which there is an irresistible desire to eat dirt. The practice of some tribes of S. America, of using certain kinds of clay for food.

Discharger, dis-chärj'er. In Elect. an instrument for discharging a Leyden jar, &c., by making a connection between the two surfaces. In calico printing, a discharge.

Discharge-valve, valv. In steam-engines, a valve which covers the top of the barrel of the air-pump and opens upward.

Discharging Arch, 'ing ärch. An arch formed in the substance of a wall to

Dirk.

Leyden Jar with Discharger.

Discharging Arch

relieve the part which is below it from the superincumbent weight, commonly used over lintels and flat-headed openings.

Discipline, 4-plin. Education; instruction; training. Rule of government. Subjection to rule. Correction; punishment inflicted by way of correction and training; instruction by means of misfortune and the like. In the R. C. Ch. bodily punishment inflicted on a delinquent; or that external mortification which a pen-

itent inflicts on himself. The scourge a delinquent uses in self-chastisement; or that wielded by his confessor. Books of discipline, two books drawn up for the reformation of the Scotch Church—the first by Knox and four other ministers in 1560, the second by a committee of Assembly of 1573, in which Andrew Melville took a leading part. This is still appealed to as the most complete and authoritative exhibition of Scottish Presbyterianism.

Dischidia, kid'-i-a. A gen. of Asclepiadaceæ, herbs or under shrubs. One species, *D. Rafflesiana*, is remarkable for its numerous pitcher-like appendages.

Disciples of Christ (Campbellites). An independent sect holding views substantially identical with the Baptists, founded in the U. S., 1809, by Rev. Thomas Campbell, a distinguished preacher of the Presbyterian church, from which he seceded, and his son, Rev. Alexander Campbell, both natives of Ireland. The sect numbers nearly three-quarters of a million communicants, most of them being in the S. and W. States.

Discobolus, kob'o-lus. In Class. Antiq., a thrower of the discus or quoit; a quoit-player. The name given by Cuvier to his 3d family of soft-finned teleostean fishes. The lumpfish (*Cyclopterus lumpus*) is a good example of the group.

Discophora, kof'ô-ra. A sub-class of the Hydrozoa, 'comprising most of the organisms known as sea-jellies, jelly-fishes or sea-nettles. A name sometimes given to the order of annelids, Hirudinea, to which the leech belongs.

Discobolus throwing the Discus.

Friction-balls, -balz. Balls placed under a heavy object to reduce the friction, while that object is moving horizontally. Some swing-bridges have such balls placed under them.

Friction-clutch, -kluch. A species of loose coupling much used for connecting machines which require to be frequently engaged and disengaged, or which are subject to sudden variations of resistance.

Friction-cones, -kônz. In Mach. a form of slip-coupling, which allows the cones to slip on any extreme pressure being applied.

Friction-coupling, -kup'ling. A form of coupling in which two shafts are connected by friction, as in the friction-clutch and friction-cones.

Friction-powder, -pou-der. A composition of chlorate of potash and antimony, which readily ignites by friction.

Friday, frî'dî. The 6th day of the week. Good F., the Friday immediately preceding Easter; which is kept sacred, in memory of the sufferings and death of Christ, as it is believed to be the anniversary of the day on which he was crucified.

Friedland, frêd'lahnt. A town of E. Prussia, 36 m. S. E. of Königsberg, noted for the great victory, June 14, 1807, of the French under Napoleon I. over the allied Russian and Prussian armies, resulting in the treaty of Tilsit.

Friendly Islands (Tonga). An archipelago of the S. Pacific, of which Tongataboo is the chief island; pop. abt. 25,000.

Friend, frend. One of the Society of Dissenters, which took its rise in England about the middle of the 17th century, through the preaching of George Fox.

Frieze, frêz. In Arch. that part of the entablature of a column which is between the architrave and cornice. It is a flat member or face, usually sculptured. A coarse woolen cloth having a shaggy nap on one side, extensively manufactured in Ireland.

Frieze-panel, 'pan-cl. One of the upper panels of a door of six panels.

Friga, frig'a. In Scand. Myth. the wife

of Odin, a goddess corresponding in some respects to the Aphrodite of the Greeks and Venus of the Romans. Called also Freya.

Frigate, frî'gât. A war vessel larger than a sloop or brig, and less than a ship of the line; usually carrying thirty to sixty guns on the main deck and on a raised quarter-deck and fore-castle, or having two decks. Since the introduction of iron-clad war vessels the term has been applied to those having a high speed and great fighting power. Double-banked frigates, such as carried guns on two decks and had a flush upper-deck. Steam frigates, large steamships carrying guns on a flush upper-deck, and having a tier also on the lower deck.

Frigate.

Frigate-bird, -berd. The name given to a gen. of tropical birds (Tachypterus), pelican fam. (Pelicanidae), and allied to the cormorants; a man-of-war bird.

Frigate-bird.

Frigid Zone, frîj'id. A space about either pole of the earth, terminated by a parallel of 66½° of latitude, known as the polar circles. At the pole the sun is visible for half the year and invisible the other half.

Frimaire, frê-mîr. The 3d month of the French republican calendar, dating from September 22, 1792. It commenced November 21, and ended December 20.

Fringe, frinj. An ornamental appendage to the borders of garments or furniture, consisting of loose threads. The use of fringes is of very great antiquity, as shown by the dresses of figures on the ancient

Assyrian Fringes.

A Remarkable Storehouse, and Work of Reference, for Almost Every Department of Human Knowledge.

This is an entirely new book, compiled by competent Editors, in consultation with the best authorities. It contains over 700 pages, and is printed from entirely new plates, and the type is large and clear. This Cyclopædia is a **Treasury of Knowledge**, and will be found of the greatest use in answering the ten thousand questions that constantly arise, in regard to dates, places, persons, incidents, statistics, etc., etc.

What the Cyclopædia Contains.

The various Arts, Trades, and Sciences, of necessity make use of technical terms, and these are so little used outside of those special branches, that ordinary Dictionaries omit a large share of them. Among the technical terms explained will be found those belonging to

Agriculture. **Astronomy.**
Architecture. **Botany.**
Chemistry. **Engineering.**
Geography. **Geology.**
Horticulture. **Mechanics.**
Medicine. **Physiology.**
Natural History. **Mythology.**
And Numerous Other Arts and Sciences.

Among other topics upon which it is very full are: **Biography**, including eminent living persons. **History**, **Literature**, and others, in nearly all the various Departments of **Human Knowledge**.

Over 1000 Engravings. On account of the size of the pages, the engravings are necessarily small, but they are wonderfully clear, and selected with a view to illustrating the subject rather than to make a show.

When we consider the vast number of topics, the judgment exercised in their selection, the conciseness with which they are treated, and the copiousness with which they are illustrated, **The American Agriculturist Family Cyclopædia** is a remarkable book.

Every one who reads, should, when he meets with a word that is new to him, or one the meaning of which he does not understand, at once look up the word in a dictionary or elsewhere. But the definitions of the dictionary in many cases are found to be meagre, and the meaning must be sought in some more comprehensive work of reference. Comparatively few can afford to possess one of the standard Cyclopædias, in many volumes.

Consequently the publishers of the *American Agriculturist* have been on the lookout for some volume sup-

plementing the Dictionary, some *multum in parvo*, which they might present to all of their readers, old and new. They now have it in this entirely new Cyclopædia, which will be ready for delivery in a few days.

PRESENT EXTRAORDINARY.

To every Subscriber (new or old), to the *American Agriculturist* for 1885, at \$1.50, whose subscription is forwarded us before Dec. 1, we will present this Cyclopædia at our office.

Or we will mail it to any subscriber in the United States or Provinces, on receipt of 15 cents additional for packing and postage, making \$1.65 in all.

Sedgwick Steel Wire Fence

Is the only general purpose Wire Fence in use, being a Strong Net-Work Without Barbs. It will turn dogs, pigs, sheep, and poultry, as well as the most vicious stock, without injury to either fence or stock. It is just the fence for farms, gardens, stock ranges and railroads, and very neat for lawns, parks, school lots and cemeteries. Covered with rust-proof paint (or galvanized) it will last a lifetime. It is superior to Boards or Barbed Wire in every respect. We ask for it a fair trial, knowing it will wear itself into favor. The Sedgwick Gates, made of wrought-iron pipe and steel wire, defy all competition in neatness, strength and durability. We also make the best and cheapest All Iron Automatic or Self-Opening Gate, also Cheapest and Neatest All Iron Fence. Best Wire Stretcher and Post Auger. Also manufacture Russell's excellent Wind Engines for pumping water, or geared engines for grinding and other light work. For prices and particulars ask hardware dealers, or address, mentioning paper.

December.

Announced by all the trumpets of the sky,
Arrives the snow, and driving o'er the fields,
Seems nowhere to alight; the whited air
Hides hills and woods, the river, and the heaven,
And veils the farm-house at the garden-gate.

—EMERSON.

WELCOME

1884  1885

OLD FRIENDS & NEW!

Your Subscription Expires.

Every subscriber of the *American Agriculturist*, whose subscription expires with the December number, is reminded of the fact by a notice printed upon the wrapper. Upon receipt of this number, will you immediately forward your subscription for next year, so that your name may be entered correctly upon our books, before the rush and hurry of the closing days of the year are upon us?

Every subscriber to the *American Agriculturist*, every canvasser, every club raiser, and every one generally, who is interested in its prosperity, will **please turn immediately** to page 562 of this issue.

Will all the subscribers to the *American Agriculturist*, who have received extra October and November numbers, please hand them to friends and neighbors.

A Supplemental Premium List.

We presented our readers, in connection with the October number, the most artistic, attractive, and freshest Premium List ever issued. Notwithstanding the articles were so numerous and adapted to every taste, we now, with this December issue, add two more pages of desirable premiums for those who secure subscribers to the *American Agriculturist*. Like those contained in the October Supplement, these new premiums have been selected with great care, and our readers can rely upon their being as represented; they number right on from those in the October Supplement. If any of our readers have mislaid the latter, they can send stamp for mailing another.

Our Family Cyclopædia.

Read elsewhere the gratifying testimonials regarding the Family Cyclopædia, presented to subscribers of the *American Agriculturist* for 1885.

FARM AND GARDEN WORK FOR

DECEMBER

Boiled small potatoes, mixed with meal, will cause pigs to grow and fatten. Give horses cut feed in the winter. Cut the hay and oat-straw together, and sprinkle on the meal; it saves the hay, utilizes the straw, and the meal itself does better service. Corn stalks should be cut for cattle. If you own an old horse, that has barely lived through the summer, it would be an act of mercy to put him out of the way now. He would otherwise eat a ton or more of hay before spring opens, and then be worthless. Keep salt before the cattle, or at least so convenient to them, that regular "salting" will not be forgotten. Farmers should make a careful study of the feeding of store cattle. They make a mistake who feed simply to keep the animal alive through the winter. It requires two-thirds of a full ration to sustain life without growth, whereas the other third will produce growth, and yield a profit on all the feed. The animal, which comes out in good condition in the spring, has a long way the start of one that, from insufficient food, must take a month on grass to get thrifty again.

Do not delay filling the ice-house, for a single day, after the ice is six inches thick and of good quality. Get out the year's supply of fire wood, and any logs needed for timber, lumber, etc.

Orchard and Fruit Garden.

Gather up all stakes, labels, boxes, and store whatever may be of future use, and make kindling wood of the rest.... Surface drainage should be provided to carry off water from rains and thaws.... Young trees planted last fall or spring, need a mound of earth at the base of the trunk, to steady them against the heavy blows, and also help to keep off mice.... Cut cions in mild weather, always taking vigorous last season's shoots. Pack with sawdust or moss, first carefully labelling them.... Strawberry beds, if not yet protected, should be covered with straw, bog hay, or leaves.... Prune in mild spells, currants, gooseberries, grapevines, etc.... If trees or small fruits are to be planted next spring, decide upon kinds, where they are to be bought, and order early.... Fruit, if stored in the house cellar in large quantities, may give off so much carbonic acid as to contaminate the air of the rooms above. Provide ventilation, connecting with a chimney if possible. Keep a thermometer in the fruit cellar to aid in maintaining a low temperature—just above freezing.... Manure should be drawn to the orchard while the ground is frozen, ready for spreading in early spring.... Gates and fences should be in condition to keep out animals.... Rabbits are most readily kept from young trees, by sprinkling the trunks with blood. Set traps.... The eggs of the tent caterpillar, which are glued to the twigs in a band near their ends, should be cut off and destroyed.

The Kitchen and Market Garden.

In most localities the weather has been favorable for doing spring work in the fall. Continue in mild spells, to do whatever will save time in the busy days of next spring.... Cold frames, in a mild winter, require close watching. If the temperature is but slightly below freezing, air must be given

every day. If the plants are not frozen when snow falls, the glass should be cleared of snow soon afterwards....Spinach, kale, and onions, that are now in the ground, should have a moderate covering of straw, bog hay, or leaves. Roots in pits, and celery in trenches, will need more covering up as the weather grows colder....Parsnips and salsify, if needed before spring, may be dug during the thaw that usually occurs this month, as also may horseradish....It is poor economy to sow seeds of uncertain quality. Overhaul the stock on hand, and reject all that are doubtful. Determine what seeds are to be bought, and order them. While parsnips, onions, and a few other seeds are uncertain if not of the growth of the previous year, cucumbers, squashes, and all of that family, will remain good for many years....Every source of manure supply should be watched, and nothing allowed to go to waste that will increase the value of the compost pile. The market gardener should be acquainted with all the manufactories in the vicinity, and ascertain the character of their refuse, with a view to securing it if of value....Have all the implements in good working order. If any are beyond repair, procure new ones. Make all home-made appliances, such as markers, dibbles, etc. Secure labels, tying materials for bunching vegetables, baskets, boxes for raising seedlings, etc., etc.

Flower Garden and Lawn.

But little can be done here save to prevent injury to trees, etc. Have the snow plow in motion soon after a storm, as the labor of opening paths is much less when the snow lies lightly. Evergreen trees and hedges are often injured by snow, which collects in and breaks them. Shake or beat out accumulations of snow, before they harden. All proposed improvements in the grounds may be leisurely considered at this season, and if a plan of the grounds is made on paper, drawn to a scale, it will greatly facilitate doing the work next spring.

Greenhouse and Window Garden.

A sudden cold snap, or "cold wave," as it is now termed, is liable to come at any time during the winter, and must be guarded against, in the greenhouse by attention to the fire, and in the dwelling by moving the plants away from the windows, to the middle of the room....Dryness of the air is the chief obstacle to successful window gardening. Plants succeed much better in the kitchen than in the parlors, as the air is charged with moisture from the cooking, etc. If the house is heated by a furnace, there should be a pan for evaporating water in the furnace, kept well supplied. If stoves are used, keep vessels of water on them....Dust is injurious to plants. Much may be prevented from settling on the leaves by covering the plants with a light fabric whenever the rooms are swept. All smooth-leaved plants, like the ivy, camellias, etc., should have a weekly washing with a damp sponge. The others may be placed in a sink or bath tub, and given a thorough showering....Water should be given as needed, whether daily or weekly. Do not water until the soil is somewhat dry. Keeping the earth constantly wet, soon makes unhealthy plants. Let the water be of the same temperature as the room. Hanging plants dry out rapidly. Plunge the pots or baskets in a pail or tub of water, and after they have ceased to drip, return them to their places....The so-called green-fly, or plant louse, is easily killed by tobacco water. Apply this when of the color of weak tea. Red spider is very minute, and works on the lower sides of the leaves. When these turn brown, the spider may be suspected. Give frequent showers, laying the pot on the side, and apply water with the syringe. Scale insects, and mealy bug, are best treated by hand-picking, before they become numerous....Chrysanthemums, when through flowering, should have the stems cut away, and the pots of roots taken to the cellar....The pots of bulbs which were placed in the cellar or in a pit, for roots to form, may be brought to the window, and as they grow, give an abundance of water. If needed, support the heavy flower spikes of hyacinths by a small stake.

Bee Notes for December.

PREPARING FOR ANOTHER SEASON.—The bees have now settled down for the winter, and should not be disturbed. Now is an excellent time to prepare for another season. Some dealers in supplies sell their wares at a discount during the winter; advantage should be taken of this, and everything that will be needed another season ordered in one lot. If the goods are sent as freight, the charge will be light. Build hives, cases, shipping-crates, etc., and make sections; fill them with foundation; place them in the cases, and pack everything snugly away for the next season. All this is pleasant work, if one has a neat, warm shop.

OBSERVATORY HIVES.—The engraving shows a single frame observatory hive, that the writer has several times exhibited at fairs, where it was constantly surrounded by an interested crowd. The hive revolves upon its stand, and can be turned in the direction to secure the best light, which greatly assists visitors in "finding the queen." The words were made by cutting out letters of gilt paper, and fastening them on with paste. In a hive of this kind, if the bees are allowed to fly, the queen can be seen depositing eggs, with workers always surrounding her, offering her food, and patting and caressing her with their antennae. The nurse bees may be observed feeding the larvae, which increase in size, until each nearly fills its cell, when the bees seal it over. The operation of sealing, and that of the young bees biting their way through the capings, may be watched in such a hive. The young bees crawl forth as soft and downy as young chickens. Should the queen be removed, there could then be witnessed the building of queen

AN EXHIBITION HIVE.

cells, and, later on, the hatching of the young queens, and the royal combats that result in the "survival of the fittest." Except when upon exhibition, the glass sides of an observatory hive should be covered with wooden shutters, to exclude the light. To furnish the bees with an entrance, a hole can be bored down through the standard, upon which the hive turns, and a tube connected with it, and passing out through the side of the house. The bees will pass in and out through this.

APIARIAN EXHIBITS AT FAIRS.—The most liberal premiums for Apian Exhibits offered at any fair in the country, have, of late, been those of the Michigan State Agricultural Society. As the result, Michigan has made the grandest display in this line ever seen in the United States. A large share of the preparations for a fine display at an apian exhibition can be made during the winter. A few hints are here given from the writer's experience as an exhibitor: Articles that are liable to damage from "punching," or "fingering," should be shown under glass, likewise those that can

be stolen. Comb-honey, packed in crates with glass sides, and piled up in the form of a pyramid, makes a fine display. Extracted honey shows to the best advantage stored in glass, and the vessels containing it built up in the form of a pyramid, or upon pyramidal-shaped stands or shelves. If placed immediately in front of a window, its beauty is increased. Full colonies of bees should be shown in hives with glass sides, and the whole surface, both above and below the combs, may be covered with wire cloth, and a space of three inches left between the combs and the wire cloth. The bees should be given a little water occasionally, and, if possible, allowed to fly near the close of day, as often as once in two or three days. Lettering the hives, as shown for the Observatory hive, will add to their beauty, and save answering the question, "what kind of bees are these?" All exhibits, that require explanation, should have descriptive placards attached. It saves talking, and increases the educational value of the exhibition. Beeswax looks well molded in different sized vessels, then piled like a pyramid, the "peak" being surmounted by some fanciful object made of wax, as for example, an old-fashioned straw hive. To prevent cracking, large cakes of wax require cooling very slowly. Large articles, such as hives, comb foundation machines, honey extractors, etc., are shown upon a platform or table, but queen cages, honey knives, bee veils, and such small wares, had better be exhibited in a show case. Perhaps the most important work that can be done this winter, is to secure the offering of appropriate premiums. The executive boards of most Agricultural Societies will meet within the next two months, and if the matter is properly brought before them, they will be likely to make a revision of the list, and increase the amount of premiums offered for apian exhibits, to an amount corresponding to the importance of the department.

Cooking Food for Swine.

The cost of pork is greatly lessened by cooking the food for the hogs. Wormy apples, small potatoes, etc., will pay handsomely for the trouble of cooking. It is the greatest fault of our pork production, that we feed corn almost exclusively. This monotonous diet, rich in oil, must jeopardize health. It is as if a man ate nothing but fat meat or corn-bread. The value of cooked food does not depend altogether upon its nutritious contents. In cold weather much good is done by feeding hogs heated food. It warms up the body, and stimulates the digestive organs to vigorous action. It pays always to warm slops in cold weather. The main reason farmers do not feed more cooked food to their swine, is fancied labor and trouble of preparing it. A good utensil is a large iron kettle, swung upon two poles of sufficiently strong wood. The bail is removed, and a piece of chain, forming a loop a foot long, is passed through each eye of the kettle, and over the respective pole. The poles are placed on forked sticks, set in the ground. The poles should be parallel, and as far apart as are the eyes of the kettle. Place near the kettle a large, light trough, made of two-inch pine boards, which may be situated in a small lot separated from the hog lot by a fence with a small gate. Old broken fence rails make excellent, cheap fuel; they ignite readily, give a quick, hot fire, and soon die down. When the cooking is done, rake the fire to one side, and bring the trough partially under the kettle on that side from which the fire has been removed. Raise the pole from that side out of the crotchets, and let it down. This will tilt the kettle on the edge of the trough, and most of the food will be deposited in it; the balance is easily scooped out with a board or pan. When only one pole is used, it is difficult to get the cooked food into the trough. After the food has cooled sufficiently, open the gate in the fence, and let the hogs in to the feast. Managed in this way, the labor of cooking a kettle of food can be done in five minutes, and the only expense of making the ration is a few pieces of old rails.

A New Departure in Mule-Raising.

An industry that heretofore has not attracted the attention in the trans Mississippi States its prospective profitableness would justify, but which of late has gradually been coming into favorable notice, is that of mule-raising. The ease with which mules can be reared, owing to their hardiness, is greatly in their favor. They can live, if not thrive, on the scant or coarse food that will maintain a mountain goat, while performing the year round an amount of drudgery really astonishing. These qualities are likely, in the future, to bring mules into a prominence which they have not heretofore enjoyed. Stockmen, noting the prices quoted from day to day in Kansas City, St. Louis, and other markets, for young mules, and the constant demand always greater than the supply, are arguing to themselves with much cogency that there is money in mules, and propose to have some of it. One basis of their calculation is, that the cost of raising a mule or a steer to the age of one or three years, is about the same; that at ruling prices a yearling steer is worth thirty dollars, and a three-year old steer sixty dollars, while, the yearling mule, if a reasonably good one, (of as good breeding as the grade steer), will command sixty to seventy-five dollars, and the three-year-old from one hundred to one hundred and thirty-five dollars. In other words, if the profits on rearing the steer are from fifteen to twenty-five per cent, the profits on the young mule, of but little greater cost, will be from thirty to forty-five per cent.

As the outgrowth of such thinking and calculation, a considerable number of farms are being stocked with the best class of low-priced mares obtainable, (mainly from Colorado and northern Texas), and these will be bred to superior jacks from Spain, Kentucky, Tennessee, and Missouri. On this account the trade in jacks is becoming greater than ever before known in the West, and some establishments are making a specialty of the importation, rearing and supply of jacks. The demand during the past year has been very active, and greater than the supply, at prices ranging from five hundred to one thousand dollars, and

Fig. 1.—"WIGWAM" FOR PIGS.

even as high as fifteen hundred dollars each. To start in the business of rearing mules requires relatively more capital than to begin rearing a like number of cattle, that is for the original stock; but for land, fixtures, feed, labor and taxes, the expenses will not essentially differ or will the per cent of increase; in fact, many think the probabilities in this respect are in favor of the mules, owing to their being less susceptible to diseases, and to the fact, as one writer states it, that "the mule comes to stay, and after he has once stood upon his feet and sucked, nothing short of a Gatling gun, a howitzer, or a stroke of lightning can upset him." The indications are

that the better the mule is known the more will he be respected, and the higher the appreciation of his long-suffering patience and modest worth.

Why Capons?

Where there are many young cockerels which are to be sold, it will pay better to make capons of them, for the simple reason that capons not only attain a much larger size, but the flesh is far more desirable and palatable, while the price is greatly enhanced, frequently doubled. The demand for

A MULE IN HARNESS.

capons is much ahead of the supply, and likely to be so for a long while to come. A number of breeders of thoroughbred fowls, now make capons of all the cockerels which are not pure enough for breeding stock, and they would not continue to do so if it did not pay. It would take much space to describe the method of caponizing. Those who sell caponizing instruments, send full printed and illustrated directions for using them. One who is familiar with instruments, can soon learn how to use these successfully, and the percentage of loss will be but small. It is generally best to operate on a few dead birds, using those killed for the table. When the anatomy of the fowl is well understood, living specimens can be caponized with a reasonable assurance of success.

How to Prevent Milk-Fever.

One of the remarkable and frequently fatal ailments of cows is milk-fever. No closely related disease is known among other animals. It occurs at calving time, hence is called puerperal fever, which is really a human ailment. It is also called parturient fever, which means about the same thing, but is more correctly applied to animals as being a fever occurring at the time of bringing forth young. Milk-fever in cows is a parturient fever associated with apoplexy. It rarely or never—so far as we know—attacks heifers with their first calves, and rarely occurs before the third calving. It happens usually in summer, and rarely in cold or cool weather. It comes on before the flow of milk is established, and is supposed to result from the blood, which for months had flowed for the nourishment of the calf, not readily taking the course to the udder, where it would be indirectly elaborated into milk, but being thrown back, so to speak, upon the vital parts, causing general disturbance and high fever with a determination to the brain. It very rarely attacks cows which are simply great milkers. Its victims are rich milkers—butter yielders. Cures are rare when the attack is in summer. They are effected by the exhibition of active purgatives with stimulants, "salts" with ginger and ale, with bags of broken ice upon the head and applied along the course of the spine.

It is surprising that breeders of discretion, knowing the danger they run every time a great

butter cow calves, should ever be willing to have them "come in" in hot weather. We believe that three simple practices will almost do away with the danger that milk-fever may take off our noblest cows. The milking of the cows up to calving—even though the milk be worthless for the last fortnight, except for pigs. (It is not necessary to milk clean out, or every day at the last, but simply to keep the udder constantly in a condition to make milk). Make sure that either by bran, roots, fresh grass, or other succulent food, or by medicine (oil or salts), the system is relaxed and cool. See to it that the cow calves in cool weather.

Perhaps there have been great butter cows, milked up to calving, which died of milk-fever, but we have yet to know of one. This long milking is no serious detriment to the cow. After danger is over she quickly recuperates, and with good food will soon yield as much as ever. The calf is the chief sufferer, as its nutriment is decreased. Still there is plenty of room in the world for it to grow, and no one need fear even that a little "runty" calf, if healthy, will not make a good sized cow, if it has

suitable feed and proper care, if it do not, indeed, grow to be a large one, as is often the case.

Keep the Pigs Warm.

As has been shown in recent articles, warmth is essential to keep swine growing, or to have the food increase their weight during cold weather. "Anything is better than nothing," in this case surely. Mr. Jesse Cowen, Vernon Co., Wis., sends us a sketch and writes: "Having tried many plans for keeping hogs comfortable in cold weather, we have struck on no other one so cheap and effective as this. Set a lot of rails or poles in the ground, deep enough to hold them steady, with the upper ends brought together like a wigwam skeleton, figure 1. Then pitch on straw all around them a foot deep, and throw on soil enough to keep out the cold, leaving on the south, or sunny side, an opening, figure 2, large enough for the swine to go out and in, for ventilation. Try it; it will save feed and put money in the owner's pocket from the day it is completed." March, and even April, are

Fig. 2.—"WIGWAM" COMPLETED.

cold enough in many latitudes to make the building of such inexpensive protectors highly useful.

WHAT TO DO WITH THE CABBAGES.—If you can sell them so as to net one-fourth to one-half cent per pound on the farm, let them go. If not, feed them out to the cows, sheep, or pigs. Better bury them and keep them until spring; you may get a larger price, and at any rate the milch cows, or ewes and lambs will turn them to good account. A correspondent in Pennsylvania says he can get only a cent and a half a head. We cannot tell what they are worth to feed out, because we do not know the weight. They are worth at least five dollars to eight dollars per ton when properly fed.

Withes.

There is something untidy in the general appearance of withes. They are not ornamental certainly, but are often exceedingly convenient and useful as temporary expedients. In mending fence for

Fig. 1.

Fig. 2.

example, nails cannot be used, and a good with well placed makes the fence firm and substantial. We have been in the habit of twisting the rod, of which the with is made, so as to start the fibres of the wood nearly its whole length, and then using it like a hand of straw, or anything else, drawing it as tight as possible with the hands. A newly arrived immigrant has shown us a better way. He makes a strong loop on the small end, as shown in figure 1, either with the twigs into which the rod is usually divided, or by twisting the rod upon itself. When placing the with in place, he passes the butt-end through the loop, and pulls it tight, as a noose. If convenient, he places one foot against the loop and pulls with all his might. Then he holds it tight by bending it slightly, and, with both

Fig. 3.—WITHE IN PLACE.

hands, giving a crank-like motion to the with, (fig. 2), he twists it until it kinks, which it does close to the loop, and then he tucks the loose end under the body of the with, as shown in figure 3.

How to Exterminate Wild Carrots.

The rains of the summer were uncommonly favorable for the growth of the wild carrot, and the meadows have been white with the "lace flowers," as ladies sometimes call this pest. A good farmer, having been very watchful for two years in extracting every plant of wild carrot from a hundred acres of meadow, finds the search this year nothing but a pleasant "walk over." Some folks are arranging for a severe two years' course of education in this particular. We doubt if two years will be effectual with meadows that have long been given over to this plant. The seeds are numerous and hardy, living in the soil for many years, and waiting a chance to sprout. The land cannot be cleaned in a year or two, unless it lie fallow, and by repeated harrowing five or six crops of the young plants are killed in a season. If there are only a few scattering plants, pulling up by the roots may answer the purpose. On some fields, when the carrots are about as plenty as the grass, pulling is out of the question. It would cost about as much as the land is worth. The plant is a biennial; the root dies after bearing seed, and mowing close to the ground is just as good as the pulling. If not cut close, it will sprout, and send up blossom shoots, and make seed three or four times in a season. The only effectual treatment, aside from the plowing and harrowing, is to prevent the seeding of the plant, by either pulling or mowing it as frequently as it may be found necessary. We took in hand about three acres of meadow in

the spring of 1882, that received the wash of neglected fields on two sides, and that of the roads on the other two, the road-sides blooming with wild carrots. Each season portions of the mowing have been top-dressed with stable manure, etc., which has greatly stimulated the growth of clover and grass, as well as the weed. The first season the wild carrots were not very plenty, and were pulled. As the ground had been neglected for many years, there was a great increase of grass, as well as of carrots, the result of the manure. The carrots were cut twice in the following year, and none allowed to go to seed. The present season most of the grass has been cut twice, and all the carrots, and early in September there was a vigorous third crop of carrots in full bloom, ready for the scythe. The third cutting prevented the plants from seeding this season. Whoever undertakes to clean his meadows of wild carrots, must surely enforce the laws against their seeding.

Swine-Farming.

We are more and more impressed with the value of hogs on the farm. Many farmers make their cows the main feature; the buildings are constructed with reference to their management, and the rotation of crops is fixed to promote the same end. We also have farms devoted to horse-breeding, and whole sections of country where sheep-breeding is the leading industry. To make these different branches of husbandry a specialty, is the right course for success. In the great corn districts of the West, hogs are raised in large numbers, but we are forced to say, from observation, that it is generally corn, more than care, which gives the business its degree of success. Often enough corn is wasted if fed with care to fatten the entire stock. The western hog does not fill the entire place for which he was designed. He is simply a condensed corn-crib, with a great many rat holes. This business basis may possibly answer where corn is cheap and land requires no fertilizer, but in the largest portion of this country corn is not so abundant that the farmer can afford to waste it, or is land so rich that it can become more productive. Hogs should be made a factor of improvement on every farm. We should have swine farms the same as dairy, horse, and sheep farms, with the fields and buildings adapted to them. Hogs should be fed in the fields, with a rotation in their feeding grounds, the same as in crops. In this way, in a few years, the whole farm can be gone over, and every field enriched. The farmer who keeps a few hogs shut up in a pen or confined in a small yard, or the one who confines his hogs year after year in the same field, do not live up to their privileges in swine-breeding; they rarely manifest the skill, or even the business shrewdness of the breeders of other stock. Any class of animals producing a great amount of food for the human family, should receive fair consideration. There is room here for solid missionary work, both in improving the condition of the pigs and of the people.

A Good Ration for Hens.

We have frequent warnings against the perils of feeding hens too much Indian corn, from people who affect poultry wisdom, and write for the agricultural papers. Where one hen suffers from excess of corn, we venture to say, ten suffer from too little. Too little feed is the besetting sin of the rural districts. We live there and happen to know; people grumble because they get only six or seven dozen eggs a year, change breeds often, make crosses, and thus their yards swarm with all sorts of barnyard mongrels, as a poor substitute for full rations. Nothing but feed in the hopper will make hens grind out the eggs. If corn was dangerous, or narrow quarters, for thirty light Brahma hens, we should have found it out this summer. Early in May, after the garden stuff began to come up, we shut up the hens in an old building about fifteen feet square, without floor, and with sides and roof

of unscrupulous ventilation. It was a legacy of past generations, and had worn itself out as a carriage house many years ago. It is a standing witness that ventilation is good for fowls. The rations have been corn, given three times a day, kept in a box, generally about six quarts a day, a little more added when the box was found empty, broken clam shells kept in another box constantly on hand—a part of the skim-milk and butter-milk from one cow, a pail of water from the pump every morning, and a run of an hour before sunset upon the lawn, where there was an abundant supply of grass. Two applications of kerosene, from the lamp filler, to the perches, have kept the fowls from lice, and the health of the flock has been remarkably good. The egg production has been abundant, and if there has been any danger in a constant supply of corn, the hens have not found it out. The eggs have been well fertilized, and the chickens strong and healthy. The theory of feeding has been that we get the most profit from fowls when we give them all they can eat, and a sufficient variety of animal and vegetable food. Milk has been the main supply of the former, and corn of the latter. We have come to the conclusion that there is a call for reform in poultry keeping. Too much liberty and low feed is bad for hens. T. B.

A Fixed Boom Derrick.

Where there is much handling of heavy barrels or sacks, as at a cider mill, one man, with some simple, mechanical contrivance, can easily do the

Fig. 1.—A BOOM DERRICK.

work of two or three, working by main strength. A boom derrick, figure 1, hung high, so that the weight shall be lifted from the ground ordinarily, when the derrick swings horizontally, is very convenient. A post is handed, and has a strong dowel at each end. The lower dowel is set in a stone fixed in the ground, close to the building where it is to be used, the upper one in a strong oak cleat bolted to the building. At the height of about five or six feet from the ground, an eye-bolt passes through the post, and another is fixed at the top. The boom is fastened to the lower eye-bolt by a three-quarter inch hooked iron, attached as shown in figure 2, while the other end of the boom has a hand with two eyes. This boom is a spar or pole, stiff enough to bear the strain without doubling up or breaking, and may be ten or fifteen feet long. The end of the boom is raised or lowered by

Fig. 2.—EYE-BOLT.

a pair of single pulleys, or by a double-block tackle, which will exert much greater power. When the weight is lifted, as out of a cellar way, it may be swung around over a wagon, and lowered into it.

TYPES OF ANIMAL EXCELLENCE.

Engraved and Re-engraved for the American Agriculturist.

Mutton and Milk.

Sheep raising is an essential part of the husbandry of Great Britain. There it is largely mutton raising, and it is really profitable on account of the vast quantities of mutton consumed by all grades of the population. The wool is of course an important item on the right side of the ledger, but the flesh is by far more so. Hence we observe the preponderance of mutton breeds. Observe the three hornless heads in the group on the opposite page. What a John Bullish look they have!—substantial, well-fed, and comfortable. The favorite Cotswold is in the lower left-hand corner. For some time he has held his place as the most popular of the long-wool breeds. The bare-poll'd Leicester pressed him close at one time, and even now has many ardent advocates, while the noble Lincoln, not shown here, has recently come strongly to the front. The fame of the long-wools, however, does not dim that of the middle-wools in this engraving, represented by the Southdown on the upper left of the group, and the delicate-faced Highland sheep on the upper right. The mutton of these middle-wools, which includes all the so-called Down breeds, the Cheviots, the dark-faced Highlanders, and the Mountain sheep of Wales, is of superior quality. In the centre of the group is the fine-wooled, heavy-horned Merino. Originating in Spain, this most valuable breed spread into France and Germany, in each of which countries it developed peculiarities under the different care received. There we have the French, Silesian, and Saxony Merinos, and in this country the so-called American or Vermont Merino, and the finer-wooled Silesians. In the lower right-hand corner we have a face strongly contrasting with the others, that of the African broad-tailed sheep, with its slender horns, lopping-ears, jaw-pendants, and the coarse, hairy wool. It has, however, wool of two qualities; the long-wool coarse and hairy, while the inner coat, close to the skin, is remarkably furry and fine, having wonderful felting qualities. It is chiefly from this that the best fez caps are made, which are so universally worn in Northern Africa and the Levant. The tail is esteemed as a delicacy.

Surely the sheep breeder has sufficient choice of varieties to suit his locality and market. Our American markets are every year becoming more and more discriminating. A few years ago the prevalence of fine-wool sheep, the flesh of which is not of high quality, gave our country people a distaste for mutton. Lamb they would eat if they could not get beef, but mutton in its perfection was not known. The introduction of the British mutton breeds is fast changing this, and our markets, particularly in large towns, show at all seasons excellent mutton, the best cuts of which sell for nearly or quite as much as beef. We get a good deal of over-fatted long-wool—Leicester and Cotswold—mutton from Canada, but our mutton-eaters are discriminating, and the better-fleshed mutton of the Downs, marbled with mingled fat and lean, which is chiefly raised nearer home, is decidedly preferred.

Sheep will probably never take their proper place in our agricultural system until our people generally learn to like mutton. This they will never do, so long as we fry chops, instead of broiling them, eat them "well done," instead of rare, and warm, instead of "piping hot." To one who knows what he wants, and has it right, there is no viand quite equal to a thick, juicy, fat, Southdown rib chop, broiled to a turn, and served hot from the broiler.

Root and sheep husbandry go together. Turnips will never have their profitable place in our farming system that they should have until we raise more sheep. Roots are good for cattle, but their advocacy is vain without sheep, and so is the attempt to raise mutton sheep profitably without roots.

Many of the noted breeders of beef cattle have for many generations exerted themselves to reduce the amount of horn and offal in cattle, while increasing the general weight of the body. With those who have bred for milk, the desirableness of small heads has not made so direct an appeal to the pocket. Our artist has illustrated this idea, by two

pairs of heads shown on the opposite page. Short-horns are upon the left, and Swiss cattle upon the right. The former has been primarily a beef breed, though it has great milk capacity if properly developed. The Swiss, on the contrary, has been bred for milk, and has a natural coarseness of head, which shows a neglect of this point, while attention has been given to promoting milk secretion.

New Invasions of the Fall Army Worm.

The winter wheat fields of the West have been devastated the past autumn by the caterpillar of the Fall Army Worm (*Laphygma frugiperda*), sometimes called the "Southern Grass Worm." Many hundreds of acres have been completely devoured by the pest, a full-grown specimen of which is

THE FALL ARMY WORM.

shown in the engraving. This enemy to the farmer has been known since 1845, when it was injurious to the sugar cane crop in Georgia. The mature insect is a mouse-gray moth, with a wing expansion of a little more than one inch. The pale yellow, and slightly ribbed eggs, are deposited in clusters upon the leaves of the plants, which are to furnish food for the worms. The engraving gives the appearance of the voracious larvæ. There are three or more broods, the last one appearing in November, and being most destructive. The insect passes the winter in an inactive, or pupa, state in the earth. When these worms appear on the young growing wheat, the field should be rolled with a heavy roller, by which most of the larvæ will be crushed. The worms sometimes move in somewhat compact phalanxes, and their progress may be checked by plowing under a strip of the grain, in their pathway. Professor Forbes, State Entomologist of Illinois, who has had considerable experience with the Fall Army Worm during the past few months, recommends sprinkling the wheat with Paris Green or London Purple. An entire horde of worms, advancing across a field, may be destroyed by poisoning a strip in front of them.

Hay and Straw Hooks.

Many farmers who have hay and straw in stacks and use but little of it each day, prefer to pull out

Fig. 1.

a sufficient quantity rather than to remove it by cutting down with a hay knife. Pulling out the hay when done wholly by grasping it with the hands, is a slow operation, whereas by using a hay

Fig. 2.

hook it is done quickly, and hay can be taken from a greater height. The simplest form of hook is represented in figure 1, and consists of a piece of

Fig. 3.

iron bent in the form shown, and attached to a pole eight or ten feet in length. The shank and other portions of an old garden hoe is easily converted into a hook by the blacksmith. A double

hook is shown in figure 2. The hook portion, made of iron, should be a little heavier than the first one shown, as the double hook will grasp more hay and pull harder. Some use a wooden hook cut from a tree, but this is not satisfactory, as the heaviest part of the pole bears the hook. This objection is avoided by selecting a small tough wooden hook or branch, and attaching it firmly to a suitably shaped pole, as in figure 3. In using hooks of this description, push the point into the stack with the barb projecting downward and pull.

An Insect New to New York State.

Mr. R. J. Swan, of Central N. Y., reports an insect new to the State, and one that if not destroyed at once may prove very injurious to the wheat crop in future years. The insect is the Wheat-Straw Worm (*Isosoma tritici*), closely related to the Joint-worm (*I. hordei*) first observed in this country in 1829, and since known as a very destructive insect in the wheat fields. The Wheat-Straw Worm was first found in 1890, and last year was quite abundant in southern Illinois where it did considerable damage. The female perfect insect is shown in figure 1, much enlarged. It is only one-tenth of an inch long, with the body black, highly polished and

Fig. 1.—THE FEMALE STRAW-WORM.

Fig. 2.—LARVÆ OF STRAW-WORM.

sparsely covered with hairs on the posterior end. Many of these females have their wings only partly developed, and some are wingless. The males have not been found. Two larvæ are shown much enlarged in figure 2; they are nearly twice the length of the female fly and pale yellow in color. In the pupa, or resting, state, the insect in its thin covering, is wasp-like in form and jet black in color.

The Wheat-Straw Worm is single brooded, the eggs being laid upon the growing wheat in April or May. The young worms, after hatching, enter the straw a few inches from the ground, and occupy the culms close to and usually above a joint. They feed upon the soft substance of the straw and sometimes become embedded in it. The hard knotty galls formed by the worms arrest the upward flow of sap, and cause the heads of wheat to ripen with light, imperfect grain. Straw thus infested does not break down like that attacked by the Joint-worm. This recent rival of the Hessian Fly and Wheat Midge may be controlled.

A part of the larvæ remain in the stubble until the following spring, and are quickly destroyed by burning. All the infested straw in mow or stack should be disposed of before midwinter, because some of the flies will emerge in late winter should the weather be favorable for them. An important precaution is the burning of all surplus straw in early spring. The absence of wings in many females renders them poor travellers, and is another resource against their rapid spreading through the country. Wheat crops should not succeed each other on the same land, and, if possible, do not let the field of one year adjoin that of the previous season. The Wheat-Straw Worm is now local in the East, and the means here given are sufficient for its extermination. A careless distribution of the infested straw throughout the neighborhood, or neglect to burn the stubble, may leave the way open for the spreading of the pest to the wheat in other localities until it becomes a national curse.

Walks and Talks on the Farm.

New Series.—No. 6.

Yesterday I had a visit from a young gentleman who is going to Nebraska to engage in raising pigs on a large scale. He has been there and thinks the business is not conducted on scientific principles, and yet it pays as well as any other branch of farming. If properly managed, he believes large profits can be realized. There need be no fears on that point. The only question is in regard to "proper management."

I have also been favored with another visit from a pig and pork-producer in this State—an intelligent, educated lady. She keeps pure-bred Berkshires, and gives them the best of care, and yet she said the profits were very small. She did not lose anything, but she made nothing. She kept the pigs solely for pork, and sold young pigs to her neighbors, but got no more for them than if they were not pure bred. She had no ambition to be a breeder. I told her that was a mistake. As long as she raised thoroughbred pigs, and raised good ones, she should sell the best of them for breeders, and dispose of the others as she is now doing. She should have two strings to her bow.

After she was gone, the Deacon and I talked the matter over.—"It is very evident," I said, "that pigs are attracting more attention than for some years past."—"I had rather raise potatoes," said the Deacon.—"You want to do both," said the Doctor. "Buy mill-feed for the pigs, and make a lot of rich manure, and use the manure to grow potatoes."—"It don't pay," said the Deacon, "and this lady has found it out, and the young gentleman who is going West will find it out too. I am sorry for him. It is you agricultural writers who induce these young men to leave the cities. They expect to hunt and fish, and live like gentlemen, and make a fortune in farming."

"The Deacon is getting worse and worse," said the Doctor, "he needs a blue pill and a dose of quinine. What harm do these young men do? The cities get young men from the farm; why should not the farm get young men from the cities?"—"Oh, well," said the Deacon, with a smile, "I suppose I am an old fogey. Let the young men come if they want to and welcome, all I say is that farming is a poor business, and they will soon find it out and be back in the cities. Wheat at eighty cents a bushel, here in the State of New York, means hard times for farmers everywhere."—"But this young man," said the Doctor, "is not going West to raise wheat, he is going to raise hogs, and I believe he will make it pay. But even if he does not, money is not the only thing in the world worth living for, and a few years on the western prairies will make a man of him."

"Have it your own way," said the Deacon, "but I tell you farming is a poor business. There are no prizes and lots of blanks. This young man will put his money in hogs, and cattle, and sheep. After he has got fairly going, the grasshoppers or drouth, or frost, will ruin his crops; cholera will kill half his hogs, and leave the other half weak and worthless; his sheep will perish in the winter, and have foot-rot and scab in summer. Lung disease may break out in his herd of fancy cows."

"Yes," said the Doctor, interrupting, "or a cyclone may strike him, or his horses be stolen, and his house burn up and he be obliged to live in a dug-out, but if he keeps up his courage he is less to be pitied than the man who, surrounded with comforts, worries himself over imaginary evils. I have great faith in these young men who go West. They will meet with no greater difficulties than the men who came here when this country was a wilderness."—"I hope not," said the Deacon, "if they have half the trials we endured, they will wish themselves back at home again."

"We are forgetting the pigs," I said, "and I have never known a time when they were more worthy of attention. Many young people are interested in their improvement. I get more letters asking questions about hogs than about any other subject. Here is one from a farmer at

Lincoln, Nebraska. He says the Poland-China hogs are all the rage, but he thinks they do not mature early enough, and he wants to know what breed he can keep that will give him pigs weighing two hundred and eighty pounds at eight months old. Now the truth of this matter is that any of our breeds will do this—Poland-Chinas, Berkshires, Cbeshires, Chester Whites, Jersey Reds, Yorkshires, Suffolks or Essex. The modern Suffolks and Yorkshires are a comparatively small white breed that fatten easily and mature early. The Essex are a black breed, with similar characteristics. The other breeds mentioned are larger. If I should say that they do not fatten as easily or mature as early as the smaller breeds, the matter would be disputed. I have always said that where hogs are kept with no reference to selling any of them for breeders at high prices, in other words, where hogs are kept solely to make pork, I can see no advantage in keeping pure-bred stock, and the same is true of cattle and sheep. Where beef only is the object, it does not pay to keep pure-bred Shorthorns or Herefords. It is like using mahogany for fuel. The breeders may dispute the assertion, but I am confident that it does not pay to keep high-bred American Merinos merely for their wool and mutton. Their value consists in their power of impressing their characteristics on their offspring, and in improving ordinary flocks. For this purpose they are of great value. But it is absurd to suppose that a sheep which gives you a fleece weighing thirty pounds—six pounds of which is wool, and twenty-four pounds yolk, is in himself, as a mere wool-producer, a profitable animal. That twenty-four pounds of yolk can be produced only by the highest feeding, and it is worth nothing when you get it. But such a ram can be used on flocks of ewes that have dry, light fleeces, with great advantage. A single cross may double the annual weight of wool, and still more the weight of fleece.

I am well aware that this kind of reasoning applies with less force to hogs than to cattle and sheep, because they are so much more prolific. It takes but a short time to get a herd of pure-bred pigs, and if the pure breeds are as hardy, as easily raised, as prolific, as good mothers, and as easily fattened as good grade pigs, then the slightly higher prices asked for the pure breeds at the start, is no particular objection. I believe, however, that as pigs are ordinarily fed and managed, pork can be produced with less care and labor from good grades than from pure breeds. And I so advised my young friend who is going to start a herd in Nebraska. Let him buy the best common sows he can find and breed them to a pure-bred boar. If he selects his boar with good judgment, he can raise "extra Philadelphias" from the start, and such pigs command the highest prices in the Chicago market."

"But," said the Doctor, "why cannot he produce such pigs from some established herd?"—"Perhaps he can; though I do not happen to know the breed. The pure breeds will either be too big or too small. The small breeds fatten so easily that they are deficient in vigor, and lack appetite and digestion. Select a sow from the large breeds, and cross her with a small-breed boar, and you get the desirable qualities of both. Such at any rate is my opinion."

A gentleman in Maryland sent the *American Agriculturist* thirty-two new subscribers for 1885, "and now," said he, "I want you to do me a favor. Ask Mr. Harris to give us something new, and not merely his old talks of '65 and '66, and tell him not to praise his own methods too much." When I showed the letter to the Deacon, a smile of amusement and satisfaction passed over his face, but he said not a word. He kept smiling and smiling; then put on his glasses, and read the letter again, names of subscribers and all. I looked at him, but he said nothing, merely smiled. I could get no comfort out of the Deacon.

It would not be true to say that this letter pleased me. I have thought of it a good deal. It is a genuine letter. It is not made up by some of my brother editors to take the starch out of me. It is

no joke. It comes from a good friend of the paper. It doubtless represents his honest views and wishes, and deserves respectful consideration.

One thing I can say, and that is, I am not republishing my old talks. Every line I write for the *American Agriculturist* is written out new. I never copy my old articles—never preach old sermons. The truth of the matter is this: These "Walks and Talks on the Farm" are just what they purpose to be. I live on the farm, carry it on myself, walk about it and talk about it. I wrote my first article for the papers on this farm in 1850. I live a quiet, and what some people would call an isolated life. If there is nothing new in these "Walks and Talks," it is because there is nothing new on the farm. I talk about what actually happens, what we are doing, and what we propose to do. Such talks are necessarily egotistical. The Deacon does not praise my doings. If they are to be praised at all, I have to do it myself! I am getting old, and I am asked to give something new. It has set me to thinking. And the conclusion I have come to is that my Maryland friend is right, I have fallen into a rut, and it is time I got out of it, and so to-morrow, Oct. 15, I propose to start on a trip West, and see other farms besides my own and the Deacon's.

"There are plenty of interesting things for us to talk about on your own farm," said the Doctor, "if you only knew it. Your plan of growing celery is new. Your method of keeping onions in malt sprouts is new. Your suggestion to raise beet-sets as we now raise onion sets is new. Your proposition to induce the Lima bean to assume a dwarf habit is new. Your extensive use of nitrate of soda on garden crops is new to me. Your method of driving a wagon and hay-rack under the trees, and gathering all the apples you can reach from the wagon, I have not seen practised elsewhere."—"Nor you never will," said the Deacon, "the horses tread on the windfalls."—"But we go over the orchard and pick them up before we commence," said Charley, "and by having two or three boys on the wagon, with a careful man to 'boss the job,' three-fourths of the apples can be picked without using a ladder. The boys get up into the tree, and stand on the limbs, and hand their baskets to the man on the wagon."

"Good for you, Charley," said I, "the plan is a good one if properly managed; but the Doctor cannot flatter me out of my resolution to take a trip West, and you shall go with me, and take your dog and gun, and perhaps we can find something to shoot."—"But," said he, "you have no gun."—"I will see what can be done," and telegraphed Mr. Judd, "I am going West to-morrow. Can you send me a breech-loading gun No. 10 bore, weighing about nine pounds?"—In an hour the answer came back from New York, "Gun shipped. Don't shoot yourself. Write us daily."—"That's business," said Charley.—"Yes," said I, "and there is now nothing to stop us. We will have a good time."

"We shall be through digging potatoes to-morrow," said Willie, "and the corn is all husked."—"Whatever you do," said I, "be careful in storing sweet corn so that it will not mould in the crib, and draw in the stalks the moment they are dry. There is nothing to be gained by delay. Gather the apples. Make only one grade this season. It will not pay this year to put second quality apples into barrels. Draw them to the dry-house. When you cannot work at the apples, harvest the beets and mangolds. Pit them in the field on the highest and driest knolls. Plow out the pits, and do not be afraid to plow too wide a strip, and plow it three or four times over, until you have a great, wide dead-furrow, and, what is more important, until the land on each side is a mass of loose, mellow earth, a foot or eighteen inches deep."—"I know," said Willie, "and you want us to mix plenty of soil among the roots in the pit."—"Yes," said I, "and do not make too wide a pit—three to four feet is wide enough, and build up the roots until you have a slanting roof, that will shed water, and then cover with straw and do not spare it."—"We will do it right," said Willie, and he will. He knows the importance of these little details, even

if they are not new. "I suppose," he said, "you will be back before we dig the celery and cabbage."—"Possibly not," I said, "at any rate, as soon as you have finished the mangolds, and beets, and carrots, and barreled all the apples, get everything in from the fields—the turnips of course last."

Hog Cholera and Corn.

We often hear it asserted that hog cholera, so-called, is due directly or remotely to the too ex-

Figs. 1 and 2.—COMMON AND IMPROVED V-GATES.

clusive use of Indian corn. There may be some truth in it, but there is no proof. Indian corn is one of the best foods for fattening hogs. It is particularly rich in starch and oil, and of course, this means a comparatively low proportion of nitrogenous or flesh-forming ingredients. Wheat, barley, and oats, contain more nitrogen and mineral matter. Peas are still richer in nitrogen.

The nitrogen and mineral matter of wheat exists largely in the bran, or in the part of the grain immediately under the bran. If corn is deficient in nitrogen and mineral matter, the evil, it would seem, could be corrected by feeding bran and fine middlings in connection with the corn. The practical difficulty is to get the pigs to eat the bran. They prefer the corn. The low price of wheat gives us a good chance to see if pigs will be healthier with less corn. We do not say that wheat is worth more than corn to fatten hogs, but it is quite probable that for young growing pigs, wheat is the healthier and better food, and if wheat is worth no more than corn, wheat is probably the cheaper food, especially for young animals. We believe in corn. It is the grand American cereal. We can raise it at less cost per bushel than wheat, but when wheat cannot be sold for more than corn, we can feed it to our animals with good advantage.

Manures for Potatoes.

Whether it will or will not pay to use nitrate of soda or salts of ammonia on potatoes, in connection with other fertilizers, depends on the price we get for the crop. In ordinary seasons, if the crop sells on the farm in the autumn for fifty cents per bushel, we could use artificial manures containing nitrogen, with considerable profit. As a rule, however, our large potato-growers will look to the soil and home-made manure for nitrogen. They

Fig. 3.—A CONVENIENT STILE.

will use what barnyard manure they can spare, and turn under grass or clover sod. They will plant on well-drained alluvial land that is rich in organic matter. In such circumstances many of our readers will be thankful for any information as to how they can profitably increase the yield of the crop. Many have obtained good results in the use of plaster, hen manure, and ashes, and we have found plaster alone sometimes remarkably beneficial. The experiments of Lawes & Gilbert, alluded to in

"Walks and Talks on the Farm" last month, would seem to indicate that we could use all our ordinary artificial fertilizers with advantage on the potato field. The "superphosphate" used in these experiments contains no potash or nitrogen. On the other hand, the ordinary superphosphate sold by the manufacturers of artificial fertilizers, contains phosphates, potash, and nitrogen. There are some superphosphates sold that contain nothing except phosphates. These are usually made from Carolina rock phosphate, and are just as valuable in proportion to the soluble phosphate they contain, as the superphosphate used by Lawes & Gilbert.

From these experiments we may safely conclude that superphosphate alone can often be used on potatoes with great profit. This would be particularly the case when the soil contains organic matter capable of affording nitrogen to the crop.

A large crop of potatoes cannot be produced unless the soil has a full supply of nitrogen, phosphates, and potash, in an available condition. Available nitrogen, however, is a costly article, and it is good policy to use up all that the soil annually affords. This we can do by seeing that the growth of the plants is never checked for want of a supply of phosphates and potash. We are now getting in this country superphosphates at reasonable prices, and farmers can use them with profit on such crops as usually command good prices.

Stiles and Gates.

The use of wire fences, which now-a-days is becoming so general, makes it desirable to have stiles or gates at points where, with the old post and rail fence, it was not necessary. The experience of some of our friends is in point: Figure 1 is a common form of gate, which they found in use. It consists of a V-shaped panel, filling the opening

Fig. 4.—A GATE STILE.

in the fence—the open ends of the V being fixed to posts equally distant from, and in a line with one of the posts in the fence, and at right angles to it. This was improved by using bent wheel-rims (fig. 2), instead of the straight pieces forming the V-shaped panel. Kept well-painted, the hickory rims will bear the exposure to the weather perfectly. The palings should be of oak, an inch wide, and half an inch thick, fastened on with screws. The opening in these stiles must be sufficient to allow a corpulent person to pass easily, even if a frisky bull is in uncomfortable proximity, and for this figure 3 is really the most convenient form. The objection to both of these stiles is, that there is no actual closing of the passage. Calves, sheep and pigs, not to mention dogs, work their way through. To prevent this, the gate-stile, figure 4, was invented. It has a small gate swinging on the middle post, but stopped in its movement by the end posts of the V. A person can pass by stepping well into the V, and moving the gate by him, where he has free exit. This form is efficient, but inconvenient. A fourth form, the best of all, is the swinging A-stile, figures 5 and 6. In this there are two light gates, made upon the same hinge post, spreading like the letter A, and braced with a cross-piece between the rails of each side, like the center part of the A. This gate is set to swing on each side of the center post, as shown. It is so much narrower than the V-stiles, that it is almost impossible for small animals to pass, but it is easily hung so that it will always remain closed, and so offer no temptation to animals on the outside. At night, or when not in use, a wire ring, or wither-hoop thrown over the top of the post, and the upright part of the gate frame, will securely fasten it. To make the gate swing shut, all that is necessary is to set the eye of the lower hinge of the gate well out towards the outside. In figure 6, we give a neat A-gate, made of pine or any strong and light wood.

Finished Products.

"Buy the best," is sound advice. Any shrewd purchaser learns to follow it at an early date, and buys of whoever has the best goods. It pays as well on the farm as elsewhere. Twenty-five cents is a common price for butter in the older States. In the dairy regions most farmers are content to sell at the medium price, at the country store, and take their pay in goods, and settle once a year. They do not have modern improvements or use ice, and are not scrupulously clean, from the milking to the packing of the balls for market. They fall short

Fig. 5.—SWINGING A-STILE.

in several respects of "gilt-edged butter." But my neighbor A. believes in finished products. He uses ice, every vessel is kept thoroughly scoured and sweet, his cream is well ripened, churned twice a week, the butter is thoroughly worked, salted by rule, packed in neat balls, and sent to market in a cold atmosphere. He does not sell at the store at the merchant's price, but supplies families at thirty-two cents a pound, and to families in the neighboring city at thirty-five cents. Every one that uses his butter is satisfied with this finished product, and continues to purchase as long as he can secure it. Mr. A. finds that Jerseys and their grades, are the best butter cows, and has weeded all others out of his herd. He milks them for ten and a half months, and has no occasion to trade off dry cows. By regulating the time of calving, he keeps the churn going the year round. Mr. B. is another neighbor, who keeps a dozen cows of high Jersey grade, makes a gilt-edged butter the year round, and sells in the city for thirty-five cents in summer, and forty cents in winter. With suitable buildings and fodder, it is no more difficult to make the best butter in winter than in summer, and the economy is not simply in the higher price. There is profit in the extra months in which his cows are giving milk. Mr. B. also keeps his cows in a warm barn, and saves largely in fodder. He gives full rations, and does not spare the meal. More manure is made, and it is of better quality. As the stock is of better quality, the heifer calves do not go to the butcher, but are raised, and, after his own herd is kept good, he finds a ready market among other farmers who want to improve their herds. As a rule, the farmer who puts the best things of their kind upon the market, finds no difficulty in selling all he can raise at a good profit.

Do APPLES HURT MILCH COWS?—We answer, no, unless they are over-fed. It will not do to give a cow free access to a pile of apples, it might

Fig. 6.—A NEAT A-STILE GATE.

not only dry up the flow of milk, but kill the cow. A peck of apples twice a day will do much more good than harm, and the sooner farmers get over this idea that apples injure milch cows the better for the cows. Apples are plentiful this year in most sections, and if fair fruit would go to waste because your conscientious scruples forbid your making it into cider, give it in reasonable quantities to your milch cows and other stock.

Teasels and their Culture.

The Teasel is one of those special crops, that in Europe is confined to certain localities, both in England and on the Continent. For some reason we have lately had inquiries as to the crop, and the manner of cultivating it. Teasels have been more or less cultivated in the older States; but the main supply is imported. A wet season is, in Europe, disastrous to the crop. Our climate is, on account of its dryness, adapted to teasel-growing. As the harvesting is by hand, and extends through about six weeks, the cost of gathering the crop is the chief obstacle to its culture in this country. To those who wish to experiment in growing teasels, we give an outline of the method of culture. The Wild Teasel (*Dipsacus sylvestris*), is found as an introduced road-side weed in the older Northern and Middle States, and it is supposed that the cultivated or Fuller's Teasel (*D. Fullonum*) is a variety derived from that. This Teasel is a strong, biennial, branching plant, some six feet high, with prickly stems and leaves. The main stem and the branches are terminated by a crowded oval flower cluster, which is about two-and-a-half inches long, and an inch-and-a-half in diameter. The small lilac-colored flowers are densely crowded on this head, and each flower is subtended by a stout bract or chaff, which is hooked at the end. When the flowers fall, the heads are a collection of these hooked bracts, and when dried, form the teasels of commerce. They are used in forming the nap upon woolen cloth, and though many attempts have been made in that direction, no substitute has been found for the teasel. The heads, or teasels, are fixed in a frame, or upon a cylinder, which slowly passes over the cloth; the hooks pull out the fibres, all in one direction, and thus "raise a nap." If any obstacle is met with, the hook will break, without injury to the cloth. Teasels need a strong clay soil, one that is not very rich. The seeds are sown in drills, twenty inches apart; when the plants are up, they are thinned to ten inches in the rows, some growers transplanting the surplus plants to other rows prepared for them. The crop is kept clean during the first season, and it is well, when winter sets in, to cover the soil between the plants with straw. The next season the flower stalk is thrown up, which branches and bears flower heads. Earth is drawn against the plants, to assist them in resisting the wind. When the blossoms drop from the heads, these are cut singly, leaving each with a stem eight or nine inches long. Each plant yields from forty to fifty teasels. The heads are spread under cover, and when dry, are assorted into three grades, the largest being known as "kings." As it takes from two to three thousand teasels to dress a piece of cloth, and these are used up in the process, it will be seen that the consumption of teasels by woolen manufacturers is very large. The crop is a very exhaustive one to the soil. A sufficient number of heads are left to ripen upon the plant, to supply seeds, which are thrashed out with a flail. Any surplus of seeds is fed to poultry, which are very fond of them. In England, the crop is regarded as an uncertain and a speculative one, as the frequent rains of that country often prevent it from properly maturing.

A NEW SEEDLING PEAR.—Mr. E. H. Bogart, Queens County, N. Y., several years ago sowed seeds of the Seckel Pear. The result was a large number of seedling pear trees, some of which are showing fruit. Last year he brought us several of the new pears, and as others came into bearing this season, he submitted specimens for our inspection.

None among the seedlings we have seen, bears the slightest resemblance to the parent Seckel. One has such an exact resemblance in shape and every other respect to the Boussock, that we at first supposed some mistake had been made, and that we had that variety instead of a seedling. A trial proved that however closely the exterior might resemble the Boussock, the flesh was entirely different, being very spirited, with a high vinous flavor, and more acidity. The flesh is fine-grained and melting, and the fruit quite good enough to bear

HEADS OF HORSES FOR SPEED.

No. 2.

the name of its enterprising originator—the Bogart. There is still room for improvement in pears.

Horse Physiognomy.

A horse's head indicates his character very much as a man's does. Vice is shown in the eye and mouth; intelligence in the eye and in the breadth between the ears, and between the eyes; spirit in the eye and in the pose, in the mobile nostril, and active ear. The size of the eye, the thinness of the skin, making the face bony, the large, open, thin-edged nostril, the fine ear, and the thin, fine mane and fore-top, are indications of high breeding, and accompany a high-strung nervous organization, which with good limbs and muscular power, ensures

No. 3.

HEADS OF DRAFT HORSES.

No. 4.

a considerable degree of speed in the animal.

We herewith present engravings of two pairs of horses' heads. The first are horses of high breeding. Number 1, is high-strung and mettlesome, with an untrustworthy eye, and a vicious mouth—a powerful animal of great endurance, but being wilful, is hard to control. Number 2, is equally high-bred, with great breadth of forehead and head, with a large, full, generous eye, not lacking in spirit. The bony face indicates blood, the ear and the thin-edged nostril show spirit, while the whole expression of the animal's face is one of abounding docility, kindness, and honesty.

In the second pair of heads, we have those of cold-blooded draft horses, not needed for speed, but for the steady exercise of muscular strength. The heads are meaty, the nostrils fleshy, the eyes of medium size. The skin is thicker than in fine-bred and thoroughbred horses, while the ears, though often small and neatly-formed, are fleshy and less delicate, and the mane more abundant. Traits of moral character are, however, similarly indicated. Intelligence is apt to degenerate into shrewd self-indulgence and laziness, with wit to

let his mate do the most work. Spirit is shown by the mobile ear and open eye, and vice by the uncertain, restless eye, the ear laid back, and the air of distrust in strong contrast to the trustful honesty of the horse's true nature. Number 3, shows a draft horse of willingness and spirit, free from vice by nature, but of spirit and intelligence enough to have vicious traits developed by bad treatment. Number 4, on the contrary, is a knowing horse, having a wise caution, laziness without stupidity, good-natured; one that will bear the whip and need it before he will do his best. The stupidly, lazy horse, that drivers call a "lunk-head," has a dull eye usually, a narrow forehead, and contracted poll. He is not represented in this group, but occurs not infrequently, is always a blunderer, forgets himself, and stumbles on smooth ground, gets himself and his owner into difficulties, calks himself, is sometimes positively lazy, but often a hard goer. He needs constant care and watchfulness on the driver's part. A buyer of equine flesh should be able to detect the good and bad qualities of the animals he contemplates purchasing. This valuable knowledge is only acquired by a careful study of the various parts of horse physiognomy.

The Exportation of Apples.

In view of the short crop of apples throughout the United Kingdom, the English journals are discussing the sources whence the needed supply of fruit is to be drawn. All the countries of Continental Europe report a short crop of apples, save France, and here the late and better kinds are not abundant. "It will be from America that the supply for the United Kingdom will be derived," is the general conclusion. It is admitted by dealers in England, that the prospects of shippers to that country, "were never more promising, particularly for the better and later descriptions of apples." It is to be hoped that our shippers will not repeat the mistake of a few years ago, when in a season of scarcity in England, all qualities of fruit—any that were apples, were sent abroad. As a consequence, many shipments did not bring enough to pay the freight. The English buyers will pay liberally for good fruit; poor stuff they will not have at any price. It is to be regretted that much discredit has been brought upon American apples, by sending over barrels that had been topped; the selected fruit placed near the heads, while the

bulk of the barrels was filled with fruit of poor quality. The practice of placing one or more layers of the best specimens of fruit upon the top and bottom of each barrel, may be desired by some of our own dealers, but it does not meet with favor abroad. An American brand no longer guarantees honest packing, and buyers insist that the contents of each barrel shall be emptied into an immense tray, in order that the entire contents may be inspected before a purchase is made. With confidence in the honesty of our packers restored, we shall enjoy a quick market for our orchard products in London and elsewhere abroad.

Renting Land on Shares.

As a rule, farmers do not like to rent land in high condition on shares, and the man who works land on shares almost always pays too high a rent for it. We have rarely seen a farm that had been rented on shares for several years that was not badly "run down." It would seem, therefore, that there is something radically wrong in the system.

The only farming that pays is good farming. We mean by good farming, draining when necessary, thorough cultivation, the destruction of weeds, saving and applying manure or plowing under green crops, and doing the work in good season and in a workmanlike manner. The man who hires

farm, it is evident that, other things being equal, the more labor a crop requires and receives for its proper cultivation, the more rent you pay.

An apple orchard in bearing condition is profitable to the tenant. Unless he has a good crop to gather and market, he need spend but little labor on it. A meadow or pasture requires but little labor.

A crop of oats or barley, or spring wheat, costs but little to put in or harvest. Crops which need hoeing and cultivating, cost more than wheat, barley, oats, buckwheat, millet, timothy, clover, etc. We have known a farmer to let land to one man to sow to oats in the spring, followed with winter wheat in the fall, and to another man land to plant to potatoes—both on the halves, the tenant to do

Others, thinking that an uncongenial soil is the cause of failure, are at great trouble to procure leaf-mould, and endeavor to imitate their natural conditions, but all without favorable results. Notwithstanding the many failures, these shrubs are as easily managed as any others. Spring is the best time for moving them. Before taking them up, cut off every branch, leaving nothing but a stem.

Public Parks—The Crotona.

Among the new parks proposed for New York City is a tract not far from the Bronx River, in Westchester County, which is frequently visited

A WOODED PARK.

Engraved for the American Agriculturist.

land on shares pays for it in labor. The more labor he puts into the land the higher rent he pays—the less labor the less rent. This is true, at least, so far as the tenant is concerned. He may put considerable labor into the land without the owner getting any benefit from it, owing to poor land or poor judgment, or the failure of the crops from floods, drouth, insects, etc. But if the tenant puts on the labor, he pays the money which the labor represents, whether the owner gets it or not. In other words, the tenant assumes the risk of poor seasons, just as much as if he paid money rent. He quickly finds this out, and sooner or later learns that the less labor he puts on the less risk he runs.

In spite of all this, we know many who have done well in renting farms on shares. They have now good farms of their own, all paid for. In fact they have bought the farms they formerly rented. Of course the owners of the farms were lucky in finding such men. If the tenants made money, the owners made money also. A great deal depends on the men. The owner must be liberal. If he can find a tenant that is industrious, careful, systematic, prompt, and forehanded, he can well afford to help him in every way in his power. In helping the tenant he is, of course, helping himself.

In regard to what crops to put in on a rented

all the work. If the oats yielded forty bushels per acre, and sold for thirty cents, the land owner got six dollars an acre rent. If the potatoes yielded one hundred and fifty bushels per acre and sold for forty cents per bushel, the landlord got thirty dollars an acre rent. You will say that the tenant also received thirty dollars per acre. True, but he spends more labor on the potatoes than on the oats.

The so-called garden crops, such as cabbages, onions, carrots, beets, rutabagas, turnips, celery, etc., all require considerable labor, and when raised on shares the land-owner, if a fair yield is obtained, gets a high rent for his land. He can afford to furnish all the manure and all the seed, and in fact should do so, and be liberal in lending the use of plows, cultivators, drills, etc. If good crops are obtained, both parties will do well.

BROAD-LEAVED EVERGREENS, HOLLY, ETC.—The few broad-leaved evergreen shrubs, native to the Northern States—the holly, the laurels, inkberry, etc., are so desirable for cultivation, that they are often transplanted from their native localities to the grounds. When thus transplanted, these fail so generally, that some have the impression that only plants grown in the nursery will succeed.

by one of our editors in his daily drives around New York in quest of interesting things for his readers. Our artists herewith present a spirited engraving from designs furnished us by the Park Commissioners of this intended woody locality, which is to be named Crotona Park. Each of the established, as well as the proposed parks around New York, has its distinguishing features. In Central Park, for example, the prevailing natural features are massive rocks, while the conspicuous artificial embellishments are bridges, of which there are many fine examples. Crotona Park, as may be seen by the engraving, will be more like the English parks, in being heavily wooded. A large portion of the tract only needs to have roadways cut through it, and a judicious thinning out of the trees for the benefit of those that remain, to adapt it to park uses at once. This brings to mind a fine private park we visited in a Western State. A farmer who had a large maple orchard, or "Sugar Bush," as he called it, had cut away all the undergrowth, laid out roads and converted his tract into as fine a park as one need have, while it was all the more convenient for its original use—a source of sweetening. This affords a suggestion to many other farmers who are so fortunate as to possess maple groves. Let them be made into parks.

A Cottage Costing \$1,500.

S. B. REED.

This is a very desirable cottage of eight rooms, with the necessary halls and closets. It is well suited to the requirements of a small family. Several houses have been built from these plans. In some cases, where persons desired to occupy only a single lot, the kitchen has been placed in the rear, instead of at the side, as shown. The cost is the same in either case. The construction is shown in the following abstract of the specification:

The height of the cellar is six feet six inches; of the first story, nine feet; and of the second story, eight feet; all in the clear. The cellar is excavated to the depth of three feet, and the loose earth used to grade around the house, at completion, leaving two and a half feet of the foundations exposed to sight on the outside. The foundation for the main house is of broken stone, laid in good mortar, eighteen inches thick, to the height of three feet six inches; the balance is of hard brick and mortar, eight inches thick, and three feet high, neatly pointed where exposed to view. The chimneys are of hard brick and mortar, laid with close joints, with separate and continuous flues from each fireplace to the top, and thimbles where required. The interior side walls and ceilings of the two full stories are hard-finished on two coats of best brown mortar, and seasoned lath. The frame is of sound timber, properly framed, raised, and secured with hard-wood pins. Beams and rafters are placed two feet apart from centres; studding, sixteen inches apart. The beams are bridged. All window frames have plank stiles, and timber sills of clear pine. The sash are an inch-and-a-half thick, glazed as indicated in the plans, and hung to balance-weights with good cord. There are outside blinds to each window above the cellar, properly hung and fastened. The outside of the upright frame is first sheathed over with hemlock boards, next covered with rosin-sized paper, and finally inclosed with pine clap-boards, to the height of the belt course. Above this it is shingled with eighteen-inch pine shingles, laid to two lines three-quarter of an inch apart, the shingles alternating, except in the front gable, where the butts are rounded and laid to curved lines. The clap-boards show four-fifths of their width, and the shingles one-third of their length to the weather. The porch and hay window are constructed of clear pine, resting on locust posts, and lattice work. The ceiling is narrow boarding, and the columns

stairs are constructed of clear pine in the best manner, with newel, rail, and balusters of ash; cellar stairs are strongly constructed of plank, and the outside steps are made as shown in figures 1 and 2. All jambs are rabbetted plank, with three-inch grooves, and four-and-three-quarter reeded architraves, with foot and head-blocks. Panels are formed under each window in the two stories, and the base in all parts matches the trim. The closets are shelved and hooked in the usual manner. Molded hard-wood saddles are placed to doors, and turned stops where required. The doors are seasoned pine, panelled and molded, the outside and room doors being one-and-a-half inch; closet doors one-and-a-quarter inch thick. The front door, outside, is heavily molded, and has

What Can be Raised in Central Dakota.

R. G. NEWTON.

First and foremost raise trees for protection, fuel, and timber. For the first two needs the Cottonwood and White Willow take the lead, on account of the ease with which they can be procured, their rapid growth and perfect adaptation to the climate. Among Evergreens, the Scotch Fir will prove valuable for shelter belts. It can be raised from seed with better success and less expense than most other Evergreen trees. Seedlings a foot high, set this spring, have made a fine growth. European Larch seed treated in the same manner, has either failed to germinate, or else the few that did, just peeped above the ground and died. The strong, and rapid-growing Russian Sunflower can be successfully grown. The first use is for protection. Plant the seeds in rows through the garden, eight or ten inches apart in the row, with the rows ten to sixteen feet apart. The plants will ward off the winds, and between them can be grown any vegetables of the tender varieties. They will also prove valuable between strawberry beds. If the stalks are allowed to stand, they will hold the snow on the beds through the winter. The heads, gathered when ripe, yield one of the best kinds of food for the poultry yard. The stalks furnish a

far better fuel than hay or corn. All the grains, wheat, oats, barley, succeed here, and most of them can be grown in the highest perfection. Many persons come here with the idea that they can put in their seed in the most slovenly manner and secure good crops. They would be heartily ashamed of such farming where they came from, but here—we are sorry to say, they sometimes succeed. In the long run good farming always pays the best here as elsewhere. Flax on sod will yield quick and sure returns, and corn is a fine and profitable crop in Dakota. For root crops this region cannot be excelled. Potatoes grow as large, sound and mealy as the most exacting could desire. Turnips and beets are large, sweet, and tender. Radishes are more crisp and tender than we ever raised at the East, and pumpkin, squash, and melon

vines act as if they disliked to see so much idle ground, and do their best to occupy it to good advantage.

The success with all kinds of live stock attained in every part of the Territory, is sufficient guarantee of the ultimate triumph of this branch of farming. The plentiful supply of wild grasses, with their well-known fattening properties, the ability to grow the best of the tame grasses, and good water in abundance, all combine to prove that Dakota will soon excel in raising live stock. The winters compare favorably with those in New York.

Camellias—How to Treat Them.

Did you ever see a large Camellia plant in full blossom? If you have not, I will risk my reputation by saying that all other flowers within my knowledge, barring the rose, dwindle into insignificance when compared with it. It excels the finest rose in doubleness and form of its flowers, and puts the virgin lily to shame for spotless beauty and whiteness; if it only possessed fra-

Camellias bloom in the winter, and at no other season of the year. Plants should be purchased of the florist in the fall or early in winter, and such plants as have flower-buds already formed; those plants, if kept in the right atmosphere, will bloom profusely, but they must have an atmosphere of fifty degrees until the buds are all expanded, after which there will be no danger of the flower blasting. As soon as the bloom has all passed off, the plants should be taken from their cool quar-

growing, and watered freely throughout the summer. They must be left out-of-doors as long as the weather will permit, but, on the approach of frost, take the plants into the house, and let them stand in a cool room, where the temperature is not over fifty degrees. This is the critical time, if they are removed into a warm temperature of seventy or eighty degrees, the buds will all blast and drop off.

If the plants are large and well-budded, a succession of bloom will be obtained throughout the

Holiday Greeting to One and All.

The cluster of engravings on the first page of this issue of our paper presents some of the varied enjoyments of the month. At this season our pleasures are marked by thankfulness to the Giver of all good, and our artist has chosen the return of the family from church, to suggest, rather than represent this feature. This is especially the season of friendly visits. Over a large portion of this country, a covering of snow makes easy communications between long separated friends, while it at the same time enforces upon the farmer something like leisure for the enjoyment of social intercourse. The exhilaration of the motion, as they swiftly glide among wintry scenes, tempt many to join a sleighing party for this alone. The young, what pleasures the season brings to them! With skate and sled, they never find the weather too cold, and their ruddy faces glow with health and the warmth of their young hearts. Older people welcome the return of winter. The crowning enjoyment of the time is the social feast, at which family and friends, after perhaps many months of separation, are gathered. Whether assembled in accordance with the New England custom, at Thanksgiving, or after the more Southern manner, at Christmas, the *American Agriculturist* sends its Holiday Greeting with a "God bless you, one and all."

High Praise from a High Quarter.

The tenth census of the United States, Volume 8, just issued, contains the following very flattering allusion to the *American Agriculturist*; "The *American Agriculturist* dates from 1842, and is one of the numerous periodicals of the same class which originated in all parts of the country at or about the same time, some of which are still in healthy existence, while others quickly subsided. The *American Agriculturist* is especially worthy of mention, because of the remarkable success that has attended the unique and untiring efforts of its proprietors to increase and extend its circulation, which at one time reached a point undoubtedly higher than was ever before attained by a journal of its class. Its contents are duplicated every month for a German edition, which also circulates widely." Probably no government publication ever before went out of its way, unsolicited, to bestow such flattering notices upon a journal published by private individuals. The time alluded to, when the *American Agriculturist* had such a large circulation, was during the war. Its friends will be pleased to learn that it is now rapidly attaining to those figures. During the past three months, the circulation has fully trebled that of the corresponding period of last year, and not since inflated war times, have the subscriptions began to compare with those received since the beginning of the present autumn campaign.

Drawn (by Folsom) and Engraved for the *American Agriculturist*.

grance, it would be unquestionably the Queen of the floral world. What I shall have to say in regard to this plant, I hope will have the effect of introducing it into many homes where it has hitherto been little known. Few outside of professional florists have undertaken to cultivate the Camellia, for the reason, we suppose, that it is thought to be quite an impossibility to raise and bloom it successfully outside of a green-house; this is a mistake, although many believe it otherwise. I contend that Camellias can be as easily and as successfully grown in the window as the rose or geranium.

ters, and placed with the other plants in a warm temperature, and watered freely, to encourage a vigorous growth previous to removing them out-of-doors in the spring. As soon as all danger of heavy frosts is over in the spring, the plants should be taken from the house and removed to some shady location, under a grape-arbor, in a pit or frame covered with shades. Here leave them standing in the pots, "plunging" the pots in earth or sand to prevent too rapid drying out. Summer is the period in which the flower-buds are formed that bloom in winter, and the plants should be kept

entire winter. There are a number of varieties, embracing colors from red, pink, variegated, etc., to the purest waxy-white. The Double White Camellia Japonica, the white sort, is the most valuable for its bloom, the flowers being sometimes four to five inches in diameter, exceedingly double, with petals imbricated, and of a waxy texture. They are invaluable for funeral occasions, when pure white flowers are required. Plants are multiplied by either grafting or budding them on the common stock; it is almost impossible to raise plants from cuttings, they are slower than Azaleas to root. J. S.

About Boy's Christmas Presents.

We do not refer in the heading to Christmas presents for boys, but to those from boys. If one of our young readers were to give his uncle a present, we should much prefer it to be something he had made with his own hands, rather than some article bought with his savings. Girls are much better off in this respect than boys, as there are so many pretty and useful articles they can make with needles, knitting, crocheting and sewing. Boys should learn to draw, and every boy can learn to use a pencil after a fashion, though all can not learn to draw equally well. A neatly executed sketch in pencil, or in water colors, makes a Christmas gift that is acceptable to any one, and especially to an older person. Boys who are skilled in the use of carpenter's tools, need not be at a loss to know what to give for a Christmas present. A carefully made, plain, small box, especially if the material is some kind of pretty wood, can be useful in so many ways, that it can hardly come amiss as a present to any friend. A boot-jack is easily made, and can be highly ornamented if you choose. A plain, strong one, has this advantage that it will be in frequent use, and thus often remind the re-

A HAT-RACK FOR FARMERS.

ceiver of the giver. We were in the store of an importer of fancy wares not long ago, and saw there what seemed to us a capital thing for an oldish boy to make as a present for his father, or some friend. It was a farmer's hat-rack, and a most appropriate one for the front entry (we know it is now called hall, but we like old-fashioned names), of a farm house. We drew a sketch of it for the readers of the *American Agriculturist*. The principal portion is an imitation square harrow; this has a diamond-shaped looking glass in the center, and the imitation, blunt, wooden teeth of the harrow serve to hold hats, coats, etc. Below is hung a double-tree, with two single-trees, mainly for ornament, but caps, etc., may be hung upon the ends. A scythe and fork, the handles crossed behind the harrow, and a sickle or grain hook are used as ornaments and give a rural appearance to the whole. As to materials, the one we saw was made of ash, but any other wood will answer, though some hard-wood with a well-marked grain, will look better than pine, unless it be Southern hard pine. The wood-work may be finished with linseed oil, or with shellac varnish. The teeth of the harrow should be of hard-wood, and not very sharp. They may be "ebonized," by staining them with black ink, taking care that they are thoroughly dry before varnishing. The blades of the scythe and sickle may be worked out of any thin stuff, that will not break readily, and then neatly covered with tin foil, which is fastened on with stiff flour-paste. The tines of the fork may be of stout wire, and all the ferrules should be of tin foil, painted

black if you prefer. Lastly, do not forget to provide a couple of strong rings, by which to hang the rack to hooks upon the wall in the front entry.

Plants for Window Culture.

Lovers of flowers often make a great mistake in selecting plants for their window gardens. They go to a florist, select plants that are in bloom, purchase and take them home, and are disappointed to find that they never afterwards look as well as the day they set them in the window. Plants should never be purchased in flower. The conditions of high temperature and a moist atmosphere, under which they were brought into bloom, do not exist in the window, and plants brought from a green-house, at once commence to dwindle. Aside from this, plants are often selected, which, under no circumstances, succeed well in window culture. Many think a plant of no value unless it flowers. If amateurs could be content with an abundance of handsome foliage, with here and there a plant in flower, they would derive much more satisfaction from their attempts at window gardening. With a view to aid those who would undertake window gardening, we enumerate a few plants that will be quite sure to succeed. In the first place, as to plants cultivated for their foliage only. The most valuable of these is Ivy. A plant of either English or Irish Ivy, to be trained up over the window, is most pleasing, or Ivy may be planted in a hanging basket, to trail over the sides and be twined up the haulds. For plants of this kind in pots, the India Rubber Plant, (*Ficus elastica*), is one of the best. Its leaves are large and vigorous, while the reddish sheaths to the young leaves are almost as handsome as flowers. The Umbrella Sedge, *Cyperus alternifolius*, looks something like a miniature palm, is easily cultivated and very showy. The universal window plant of Paris is *Aspidistra lurida variegata*, which has no common name. Our florists supply it, and it is an excellent plant for the window. The plant known as Wandering Jew, Aaron's Beard, and by many other names, is *Saxifraga sarmentosa*. It throws off runners, which hang over the pot or basket in a graceful manner, and though it sometimes blooms, the flowers are not showy, and its chief beauty is in its variegated leaves. Among plants to flower in the window, we place first the Chinese Primroses. If plants are to be procured from a florist, select those that do not yet show their flower buds. They will flower for a long time. Some of the Begonias, such as *B. fuschoides* and *B. multiflora*, are free-flowering, and of easy culture. The so-called Crab's-claw Cactuses (*Euphyllium*) are excellent window plants, as are *Sedum Sieboldii*, the Cigar Plant (*Cuphea*), and Cyclamens.

Gas Tar and its Uses.

In the manufacture of illuminating gas from bituminous coal, a large quantity (amounting to about eight per cent of the coal), of a thick, black, strong-smelling liquid is collected, known as gas tar and coal tar. This is a very complex substance, and by distillation yields several oils, etc., leaving behind a solid pitch, called coke-pitch, and incorrectly asphaltum, true asphaltum being a natural product. Gas tar, as it comes from the gas works, is used for various purposes, among others, for the preservation of timber, especially fences and fence-posts, for the making of roofing composition, and in laying what are called asphalt walks. We have had complaints, that it appeared to be of little value in preserving wood, and several have inquired as to the proper method of using it. It is not unlikely, as there are different kinds of coal used in gas making, that the tar varies greatly in its properties. In England, where it is much more used than with us, one writer recommends as follows: Three gallons of coal tar, in an iron kettle, is set over a slow fire and allowed to simmer for about an hour. This should be done in the open air, as there is danger of its taking fire. After it has simmered for this time, add a handful of fine quick-lime, and stir well together. Remove from

the fire, and add a quart of benzine or naphtha, or sufficient to make it work well from a brush. The coal-tar thus prepared is applied to fence-posts and other wood while hot. The writer says: "Two coats will do, and will make any kind of wood proof from all weather for years." Another writer advises to make use of the tar as it comes from the gas works, adding enough benzine (from half a gill to one gill to each quart of tar), to make it work like thin paint. It is to be applied with an old brush to the wood, which should be perfectly dry.

Chrysanthemums as Window Plants.

Those who treat Chrysanthemums exclusively as garden plants, fail to get all from them that they are capable of doing. In most seasons, when left to bloom in the beds, severe freezing makes an

Fig. 1.—LARGE CHINESE.

Fig. 2.—POMPON.

end of them long before the flowering is over. If the plants, or a sufficient number of them, are potted when the buds appear, they will make most showy window plants, and keep in good condition for a long time. Their season may be greatly prolonged if they are kept in a room in which there is no fire. After the flowers have passed their prime, cut the stems entirely away, and keep the pot in the cellar, or in a frame, until spring, when the roots can be planted out again. Those who know only the old garden form of many years ago, will be surprised at the great improvement that has been made in the chrysanthemum. The forms of the original large-flowered Chinese kind, (fig. 1), are so numerous, that they are separated into classes or groups, according to the form of flowers, and we have the anemone-flowered, the recurved, the incurved, and other groups. The set with very small flowers, figure 2, known as pompons, do not make such a show as the large-flowered kinds, but they are exceedingly neat and pleasing. The Japanese chrysanthemums (fig. 3), are of comparatively recent introduction. The florets of these are much longer than in the others; this gives them a tassel-like appearance, quite unlike that of the forms of the Chinese. Some of these flowers are so graceful, that they are used as cut flowers in bouquets and other floral work. The chief fault

Fig. 3.—JAPANESE CHRYSANTHEMUM.

with chrysanthemums as window plants, is their height, their tall stems tending to lose their leaves, and become "leggy" below. This can be prevented, and the habit of the plant changed, by pinching the growing stems, when they are at the desired height. This will cause each of the stems to branch, and form neat, compact, bushy plants.

Care of the Banks of Streams.

While it is very desirable to have a stream of water upon some part of the farm, the advantages attending it are sometimes more than offset by the damage resulting from a freshet. A farmer of our acquaintance had a small stream or brook crossing a portion of his farm in a rather tortuous course. As this was visible from the road, the irregular ways of the stream were not in accordance with his ideas of neatness and regularity, and he at considerable expense had the course of the stream straightened, and the water was made to flow between straight banks, like a ditch. The stream, though it had occasionally overflowed, had given no particular trouble, but after its course was altered, during freshets, and at every time of high water, the bank was worn away in places, and repairs were often required. This became of such frequent occurrence, that the farmer after a while abandoned the attempt to make the water flow in a straight course, and being left to itself, the stream resumed almost its original crookedness. The washing of the banks of a stream depends in part upon the nature of the soil, and in part upon obstructions in the stream, which direct the water against a particular portion of the bank, and soon wear it away. Stones, stumps, and all other obstacles to the free and even flow of the water should be removed. Places in the banks, that have a tendency to wash, may be strengthened by planting willows, the fine roots of which permeate the soil for a great distance, and aid in preventing washing. The White, or the Golden Willow, will answer to plant; they should not be allowed to grow up as trees, but be cut annually like osiers. When the bank of a stream has been broken away, the damage should be repaired as soon as the water subsides. The method of doing this will depend upon the materials at hand. One plan is, to drive a row of piles or stout posts, about nine inches apart along the break, and two to three feet into the soil. These are strengthened by nailing a string-

method of repairing a washed-out bank is shown in figure 2. Here piles are driven in a slanting direction, as at *a*; these are supported by others, driven in the opposite direction (*b*), and the two rendered firm by short pieces (*c*), nailed across between the two. Planks are laid close together on this frame-work, and securely nailed. Earth is filled in behind and firmly packed. The banks

the hogs do not go deep enough, make holes with a sharpened stick, and fill them with shelled corn. An enterprising hog will go to the bottom. J.M.S.

Does it Pay to Grind and Cook Grain?

No general answer can be given to this question. For man it undoubtedly pays. Most of us think we have more brains than stomach. We find, or think we find, bread more digestible than raw wheat, and consequently more nutritious. For young animals, we believe it frequently pays to grind or cook grain. We want something that will in part take the place of milk. It is not an easy thing to find a substitute for milk. Oat-meal gruel, or corn-meal gruel, with a little fat in it, we have found excellent for young pigs. Milk would be better, but we are often short of milk. For sheep it seldom, if ever, pays to grind grain. Beets and cabbages it does not pay to cook; cows, sheep and pigs will eat all you can spare them, raw. We have known turnips cooked for pigs and mixed with meal; it is doubtful if it pays to thus prepare turnips. Potatoes, contain much starch, and can be cooked to great advantage.

When grain is very high in price, it pays far better to grind and cook it, than when it is low in price. When sixty pounds of good, white winter wheat will only buy sixty pounds of so-called corn-meal, it does not pay to draw the wheat to the miller, and bring back the corn-meal to feed to pigs, cattle, and horses. If a farmer attends to the feeding himself, he can give whole corn, oats, rye, barley, and wheat to his pigs, cows, sheep, and horses, in such a way that little will be voided whole, or undigested. Grinding and mixing the meal with cut or chaffed hay, straw, or corn-fodder, may be more economical in the hands of the average farmer than feeding whole grain. But

Drawn and Engraved for the American Agriculturist.

should be turfed, as this serves as a protection when the water rises, and also improves their appearance.

Litter Swine Lightly.

There is but little danger of horses, cattle, and sheep being given too much litter; but where swine have a shelter that wards off winds and rain, and where the hogs are allowed to herd together, they require very little litter. Giving them too much is a common error, and is the source of nearly all the bronchial and pulmonary diseases which affect hogs in the late winter and early spring. The body of the hog is of such a nature, and these animals lie so close together, that if they have for litter a poor conductor of heat, they become overheated in the shelter and chilled when they come outside. But the liquid excrement of swine is too valuable to be lost, and they should be supplied with dry earth. This affords a convenient means of saving both solid and liquid excrement, and does not lead to disease. When hogs rapidly foul their bed, the litter should be removed each morning and a new quantity supplied.

To be profitable, the litter must be properly composted. Build a four-square pen of poles in any convenient situation, and place a roof over it that will effectually ward off the rain. Into this pen throw the litter and manure, being careful to keep the mass level or lowest in the middle. There is no drainage from the pen, as there is a roof over it. Use enough litter to hold all the urine; it rots well, rarely requiring forking-over before using. It is, however, easy to build another pen at one side, and throw the compost from one to the other. Frequently fork over the surface, going as deep as possible, scatter shelled corn over it and turn in the hogs, being careful to turn them out as soon as they have done rooting. If

Fig. 2.—REPAIRING WITH WOODEN FACING.

then, meal cooked or uncooked, can be fed in such a careless way, that a large percentage of it will pass through the animal in an undigested form. With proper conveniences, we believe soaking grain for twelve, twenty-four, or thirty-six hours, in cold or warm water until it is soft—but not sour—always pays well, even for feeding sheep. To say the least, opinions differ as to the importance of cooking fodder for the live stock.

Fig. 1.—REPAIRING RIVER BANK WITH STONE.

piece to the posts near their tops, and another below. Brush is laid in behind the piles, earth is placed on the brush, and well trodden down, and the surface of the bank sodded. If stones are abundant, they may be used in repairing the injured bank. Figure 1 shows the manner in which they are laid, and the method of strengthening the wall by means of piles and timber. Another

Scattering Fertilizers by Hand.

Professor Storer, of Harvard University, has been experimenting with a view of answering the question: "About how much of a given fertilizer would a man naturally throw from his hand in sowing an acre?"—A half acre was measured off, marked with stakes, and a careful laborer, familiar with such work, without any knowledge of the intended experiment, was set to scattering different kinds of fertilizers, "as if he were sowing grain thickly." The following were the results per acre: nitrate of soda two hundred and fourteen pounds, muriate of potash one hundred and seventy-three pounds, superphosphate of lime one hundred and seventy-three pounds, blood, bone, and meat-dust fertilizer one hundred and twenty-four pounds. The last named substance was a light, soft and dry powder, the dried refuse of a slaughter house, weighing fifty pounds per bushel. The superphosphate was a dry powder, weighing sixty-eight pounds per bushel, and the potash-salt was likewise a fine powder, sixty-nine pounds to the bushel. The nitrate of soda was somewhat coarse, and a bushel weighed eighty-eight pounds.

A second set of sowings, was likewise made by a tall young student in every way the opposite of the careful laborer. He carried the fertilizer in a bag slung on his shoulder, and walked at a more rapid pace than his predecessor, who carried the fertilizer in a pail upon his arm. His scatterings were: nitrate of soda one hundred and ninety-four pounds, and muriate of potash one hundred and sixteen pounds. The difference in the case of the soda-salt is not great, and two hundred pounds may be taken as the average amount a person will conveniently scatter upon an acre; with the potash salt the difference between the sowings was greater.

Ivies—Growing and Training.

The Ivy is one of the oldest and most venerable of all climbing shrubs, and preëminently the poet's vine. In some of the older countries, especially in England, where the climate is particularly favorable to its growth, the Ivy is very attractive, and is said to reach the greatest perfection there. Travellers who have journeyed through that country, describe the old Ivy as clinging closely to, and completely covering the walls of ancient castles and churches, and often it runs rampant over the fields, mounting stone walls, clinging to trees, etc. The Ivy in our climate is entirely hardy, enduring the severest winters without protection. If the vine is allowed to grow over the walls of a dwelling, either on the inside, in a living-room, or on the outer walls of a building, it is not only beautiful as an ornament of the home, but beneficial; in a sanitary point of view it is regarded as useful. Some plants of Ivy growing in the living and sleeping rooms, will do more to keep the atmosphere of the apartments pure and wholesome, than anything we can possibly imagine, and we recommend their more extensive cultivation in malarial localities. The Ivy may be easily cultivated from slips or layers. In soil, sand, or even in pure water, cuttings will root, and they will take up with almost any kind of soil, but that which can be easily kept loose, is preferable. The Ivy is partial to shade, and if it never saw the sun it would make no difference, as it would grow and flourish just the same. There is no sight more attractive in a window-garden than a fine Ivy vine trained up the casement, over the wall and ceiling; its dark, rich, glossy leaves, and thrifty look, make it an object to be admired. When grown in pots in the house, the soil will soon become exhausted, if the plant is growing rapidly, and it should be changed or enriched with decayed manure at least once each year, care being taken not to disturb the roots to a great extent. It is a mistake to allow Ivies too much pot-room; they will do better if the roots are considerably confined. Soap-suds or liquid manure if applied once a month when the plants are growing, will promote a luxuriant growth. When dust accumulates on the leaves, as it will, if grown in-doors, wash off

with a damp cloth or sponge; if this is long neglected, you need not be surprised if you soon find that the leaves are covered with red-spider or scale-lice. Cold water is the best wash; when using this, be sure and treat the underside of the leaves as well as the upper surface. We would recommend the "English Ivy" as being the best sort for general cultivation.

Cuttings in the Window Garden.

Those who try to raise plants from cuttings in their window gardens, fail more frequently than they succeed. A cutting is a small branch, or short piece of stem, and usually with its leaves.

A CUTTING POT AND BELL-GLASS.

These leaves are constantly evaporating water, which, so long as the cuttings remain attached to the plant, is supplied by the root. When the slip is severed from the plant, the supply of moisture is removed, but as evaporation continues, the leaves wilt, and the cutting itself will soon die. The air of our living rooms is exceedingly dry, and is thirsty for moisture. If cuttings are set in a pot of soil, the dry air takes up moisture from their leaves, more rapidly than it can be supplied from the soil, through the wounded end of the stem, and the slips soon fail. If we place a bell-glass over the cuttings, as in the engraving, the air within the glass soon becomes saturated with moisture, and, as it can take up no more, it no longer makes a demand upon the moisture of the cuttings. Preventing evaporation in this manner, is often called by gardeners "keeping close." Usually the edge of the bell glass sits upon the surface of the soil of the pot. Some pots are made with a groove in their rim, which receives the edge of the glass. Small cuttings may have a tumbler, goblet, or other glass turned over them. All who would grow plants from slips, cannot procure such glasses, and must contrive some other method of "keeping close." A small glazed frame, like a Wardian case, may be set over a pot of cuttings. The pot may be set in a tight box of the proper size, which may be covered by a pane of glass. If the top of the box be cut sloping, like a hot-bed frame, more light will be admitted. There are but very few plants that have not been propagated by cuttings of some kind, and if the amateur gardener fails with one method, he should try another.

Wardian Cases—Jardinieres, etc.

A Wardian Case consists of a base, generally an oblong box, covered with a square glass frame, under which certain plants can be successfully grown. This is now considered by many as a desirable ornament in the window-garden during the winter months. When neatly and artistically filled with suitable plants, a Wardian Case becomes a thing of beauty. These cases can be easily and cheaply made by any one possessed of ordinary mechanical skill. The base or box should be oblong in shape, at least eight inches deep, and lined inside with zinc or tin-plate, securely soldered to prevent the water and soil from staining the wood. A case made in this manner will endure a number of years without decaying. Over the case a square glass frame should be made to fit snugly,

and it should be from eighteen inches to two feet high, so as to allow the plants that are to grow under it plenty of room. When the case and frame are finished, the whole should be mounted upon a stand, or legs can be made, and under them place casters, by which to easily move the case about. Before planting, make a small funnel hole through the bottom of the box, to allow the surplus water to escape rapidly, and before putting in the soil, cover the bottom of the box two inches deep with broken crocks or charcoal, or even gravel, to facilitate a rapid drainage, a matter absolutely essential to the healthy growth of plants. Fill the box within an inch of the top with fine, rich, peaty loam, and all will be ready to receive the plants. Those suitable for growing in a case of this kind, should be such as will live and thrive in a moist, still atmosphere, and are of slow growth; all rampant, rank growers must be discarded as being wholly unsuitable, as they would soon become of such proportions that they could not be confined in so limited a space. The following plants are eminently suited for Wardian Cases, Jardinieres, etc., viz: fittonias (*gymnostachyum*), fancy caladims, tradescantias, *Cissus discolor*, and gesnerias. Some varieties of crotons, dwarf-growing hegonias, fancy ferns, lycopods, etc., etc., are very useful for this purpose. In arranging the plants in the case, particular care should be taken to have them so placed that the tallest growing ones will be in the center, and grading downward, according to size, the lycopods being on the bottom. The whole surface of the soil may be covered with the trailing *Lycopodium*; by placing small pieces here and there, it will soon spread over the entire surface, making a beautiful ground work of purplish-green. Small, highly-colored sea-shells, and beautifully-colored pebbles, are scattered about among the plants, to enhance the beauty of the whole. After the case has been filled, the soil should be thoroughly soaked with lukewarm water. Remove the case to a shady place for three or four days, to allow the plants to recuperate, after which it can be placed in the full light with safety. The lid or top should be lifted whenever there is excessive moisture on the inside, which will be indicated by the moisture trickling down on the inside of the glass. As a rule the plants should have fresh air, by lifting the lid for a few minutes each day, but beware of all cold draughts, or too much exposure to chilly atmospheres. Ordinarily, once a month is often enough to water. This must always be governed by the circumstances, but they should never be allowed to become dry, remembering that with warmth and moisture success is certain.

Blue Hydrangeas.

That old-fashioned flower, *Hydrangea Hortensia*, is still a favorite with many. Its enormous flower clusters are ordinarily of a deep pink color. Occasionally, the plants, without any known cause, produce light blue flowers. Flowers of this color are more showy than the ordinary pink ones, and many have claimed to be able to produce blue flowers at will, by giving the plants particular mixtures of soil, especially those containing a large proportion of peat or muck. Those who have tried growing the plants in such soils, have rarely been rewarded by blue flowers. An English gardener now claims to be able to change the flowers to blue, by the following treatment: He mixes a good potting soil of loam, leaf-mould, sand, and a little bone-dust, and to each bushel of such soil, adds four ounces of sulphate of iron (copperas), in coarse powder. The plants, after blooming, have their stems cut back to two or three eyes. When they commence to grow, they are potted in the above described soil, shortening back the large roots. The plants are kept dormant during winter, and when they begin to grow freely the following spring, are watered, at each alternate watering, with a solution of alum, made by adding a teaspoonful of powdered alum to a quart of water. After using the alum water for two weeks its strength is slightly increased. Weak liquid manure is given, and the plants frequently syringed while growing.

Connecticut Red Cattle—Good Oxen.

In the early settlement of New England, the cattle of the colonists came from the south of England and were largely of the South Devon blood. They were uniformly reddish, coarser boned than the North Devons, and of more variety in their shades of color. Besides, they were not bred pure, yet the red color prevailed and has ever since been the predominant color. It is possible, as Mr. Allen suggests in his "American Cattle," that some pure Devons were imported into New England in the previous century, of which we have now no record, but more likely that care in breeding the South Devons, which were common,

There certainly is a style about them which no other cattle have, and their advocates claim extraordinary docility. They are high strung and mettlesome, like thorough-bred horses, quick in their motions, fast walkers, not timorous, willing to pull "for all they are worth," patient, good feeders, and make the very best beef. This last quality depends of course more or less on the age of the ox. It therefore pays to work them a few years and turn them into beef, when there are others coming on. Still, a good yoke of Devon oxen will last and do hard work for many years, and at twelve or fourteen years old will fatten well and make better beef than common cattle several years younger. It is rather remarkable that a team

portrait of a pair of five-year-old Devon oxen, raised in Litchfield Co., Connecticut, which Mr. Stewart Hartshorn, of New Jersey, has just purchased, and which our artist has met and sketched on their passage through this city. The engraving likewise presents a life picture of the Yankee boy, who accompanied the oxen, with his long whip, and a coil of rope loosely swung over his shoulder, like a Highlander's plaid on his native heath.

Provide Green Food for Poultry.

Green food is fully as essential for poultry in winter as in summer. Their confinement to dry food

A YOKE OF DEVON OXEN.

Drawn (by Edwin Forbes) and Engraved for the American Agriculturist.

developed their finer qualities. Soon after the last war with Great Britain, noted cattle breeders of Baltimore imported some fine North Devon—or rather well bred Devon cattle, and other importations continued to be made. It was not very long before several herds were established in Connecticut, and they "nicked" so well with the "native" red cattle that the progeny of Devon bulls and native cows could hardly be distinguished from thoroughbreds. As a result the bulls of the improved race were in demand and a great improvement was noticeable. The color was brighter and more uniform, white noses and white switches predominated, and the animals had better forms for beef, while their milking qualities were, to say the least, unimpaired.

The great hold which the breed had and has upon the heart of the Connecticut farmer rests upon the style and excellence of the working oxen.

of oxen which will walk off on the road four miles an hour, or trot with a wagon like a pair of horses, will draw a plow in rough stony land slowly and carefully, being watchful when it strikes a stone or is "snagged" in a root, not to jerk, or throw their full weight upon it unless so directed, they as it were, trying to ease the plow over obstacles. In this respect good oxen seem to have more sense than ordinary horses, proverbial as the latter are for "horse-sense."

Breaking steers is the Connecticut boy's pastime and pride. He often begins with calves at six months old, yokes them and has them trained not only to "come up!" "gee!" "haw!" and "back!" but to drive without the yoke, single and double, sometimes to kneel, and to lie down. The steers are fit for some kinds of light service at three, efficient at four, and in perfection as oxen at five.

The engraving which we present is an accurate

during the continuance of cold weather goes far to account for the scarcity of eggs at that season of the year. Fresh winter eggs are always in demand and bring a good price in every market. Hens, like cows, should be producers as well as consumers during the cold months of winter. Farmers, as well as fanciers, should have a supply of green food safely stored away for the winter use of the poultry. Fowls are not very particular as to the kind; they readily eat celery, tops of onions, turnips, etc.; lettuce, cabbage, and apples also are relished. If such supplies have to be purchased, it is cheaper to buy one or two hundred heads of cabbages of second quality, which can be had at a low figure in autumn or early in the season. These should be delivered with their roots, and buried up to the head in sand in the cellar. Hang a head in some convenient place in the house where the fowls can pick at it.

Feeding and Care of Farm Animals.

PRIZE ARTICLE—BY "A WESTERN FARMER."

Poultry.

It is not advisable to have poultry in large flocks. Even with the best of care and food they cannot be kept thrifty and healthy for any considerable period of time. Experience teaches that sixty hens, properly housed and cared for, will yield twice as much clear profit as two hundred crowded or neglected. There are many varieties of fowls, and which to select is often a perplexing question. The large, heavy breeds, require more care and food than small, active fowls, but they are the best for broilers, and when fat, always sell well in market. They are quiet, rarely traveling far in search of food, and for this reason are best for small farms, or where they must be yarded a large portion of the year. On the other hand, where range is unlimited, the smaller, active breeds, are preferable, as they will find nearly all the food they require, thus costing little for keep, while, as a general thing, they are the best layers. The average farmer will find a cross between the large and small breeds the most satisfactory. A flock of chickens can be readily improved by the use of well bred cocks. Two are sufficient for an ordinary flock.

The house shown in figure 1, is fourteen by twenty-eight feet, eight feet high in the center and five at the sides. The walls are dressed barn-siding, nailed on both sides of braced studs, the space between being filled with dry sawdust, which makes them six inches thick. They rest on a foundation of brick, eight inches wide, which renders them ab-

Fig. 1.—A SMALL POULTRY HOUSE.

solutely vermin-proof. The roof is double, filled in with sawdust, same as sides; floor is bare earth, smooth, dry, and hard. A door is in the east end. In the bottom of the door is an opening twelve by eighteen inches square, fitted with a sliding shutter, for the poultry to pass in and out. The two windows rest in grooves, so that they may be slid open, and are covered with coarse wire screens. Extending from the south side of the building is a glass-covered run, nine by twelve feet, the floor of which is eighteen inches lower than that of the main building. In its outer end are two openings for ventilation, twelve by eighteen inches square, covered with wire screen, and fitted with sliding shutters. In the main building are the perches, *r, r*, figure 2, placed two and a half feet above the floor, and fastened to the wall with strong hinges, so that they can be raised when the droppings are scraped out. The nest boxes, *n, b*, are fastened to the walls six inches above the floor; the cover over them slopes down, so the fowls cannot use them for roosts. The feed trough, is four inches wide, four deep, and eight feet long. The water box, *w*, is a tin box or deep pan, set inside a wooden box having a hole three by four inches square in its cover. The sand, gravel, and bone-boxes, *o, p, q*, are near the door. A dust-box is in the glass addition. A breeding-pen, *b, p*, is seven by eight feet square, separated from the main room by a wire-screen partition, with entrance, *e*, in one corner. It contains nest boxes, perch, etc. This house, though a comparatively cheap affair, is substantial, and answers the purpose for which it is designed much better than many houses ten times as costly.

WINTER CARE OF FOWLS.—We will start with thirty one-year-old hens, thirty pullets and two cocks as a sample flock. As eggs bring about three times as much in winter as in summer, our efforts will be directed to inducing the hens to lay during that season. About the middle of October the cocks are shut up in the breeding-pen. The

hens are fed twice a day with all the food they will eat. The morning meal consists of cracked corn, wheat screenings, oats, and boiled potatoes mixed together with boiling water, covered up and allowed to stand an hour or so. A few chopped onions, pieces of meat, or pork scraps from which the lard has been tried, and a small quantity of cayenne pepper are added when fed. The evening meal may be cracked corn, oats, and wheat screen-

Fig. 2.—GROUND PLAN OF POULTRY HOUSE.

ings fed dry. A head of cabbage is fastened to the wall, about six inches above the floor, for fowls to pick at. Apples are relished and may be fed occasionally, chopped fine. Fresh water is supplied daily. Warm skim milk is excellent in cold weather. Rinse the troughs out well every day. A few barrels of dust are placed in the house in summer for use in winter. The dust-box is a foot deep, four feet long, and three wide. It is kept well supplied, and on bright, sunny days the fowls gather in the glass apartment and enjoy the sun and a dust bath. The sand and gravel boxes are kept full of coarse sand and fine gravel. The bone box is always supplied with bones, ground or broken to the size of peas, old plaster or lime, and crushed oyster shells. Nest boxes are cleaned out once in three weeks, sprayed with kerosene, and lined with fresh straw slightly sprinkled with sulphur. Perches are sprayed with kerosene once a month. The droppings beneath them are cleaned out every morning, and the floor of the whole house is scraped once a month with a scraper made for the purpose, and shown in figure 3. About once in two months all the fowls are driven out of the building, the ventilators closed, and a large pan full of live coals set inside, upon which is thrown a double handful of sulphur. The door is quickly closed and kept shut for an hour, when the fumes will destroy every living thing in the

Fig. 3.—A SCRAPER.

building. The windows and ventilators are opened and the house well aired before either person or fowl is allowed to enter. Once a year the entire interior of the building receives a coat of fresh lime whitewash to keep it clean and sweet.

PEKIN DUCKS.—Ever since its first introduction into this country, the Pekin duck has steadily gained in popularity, until now it takes a front rank amongst desirable breeds. Like any other poultry, this breed does not please all equally well, though the majority of farmers and breeders who have tried the Pekins thoroughly are satisfied with the results. In size they take the lead, when given a chance to properly mature and develop, by hatching early and feeding liberally and regularly. They are pure white, hardy, vigorous, and prolific. They stand confinement as well as any other ducks. By hatching the eggs under common hens, a single trio of ducks kept constantly laying will produce a large flock in a single year. Some breeders contend, and with good reasons, that the only mother the ducklings need is a mud-puddle, and if they have plenty of water and a comfortable, clean house, to run into at night, they seem to get along as well as when under the care of a foster mother—an old hen.

Light in the Winter Quarters.

An abundance of light in the shelters provided for stock in winter, is a point which should not be overlooked, for darkness is as injurious to animals as it is to plants. Human beings spending much of their time in dark tenements, are pale, sickly, and dwarfed. Confining the lower animals in dark quarters, has a similar effect—retarding growth, and reducing vigor. Much of the blindness among horses is caused by their being brought suddenly from a dark stable into the strong sunlight, which is especially trying when reflected from snow. The openings in shelters are closed with boards or straw, "to keep out the cold;" unfortunately this keeps out the light also, so that a majority of the stables in this country are dark for three-fourths of the time during which animals are confined in them. This is all right at night, but during the day time, the stable should be as light as the dwelling, and made so in the same way—by glass windows. A few panes of glass and sash, will not cost much, and a more profitable investment can not be made. Shutting up shelters so closely, also shuts out the pure air. Leave a wide crevice under the eaves. The inside impure air becomes heated and lighter, as it becomes foul, and will rise and pass out at this crevice, and the outside, pure air, being colder and heavier, will enter. The animals will have pure air, and no blasts will strike directly upon their bodies. Leaving openings in the roof, and building small houses (often improperly called cupolas), with lattice-work sides over them, is a splendid way to ventilate barns and stables, and improve the looks of the building.

Improved Cattle Tie.

While the *American Agriculturist* has always recognized the convenience and excellence of stanchions for cattle, it has protested against the obvious cruelty of locking any animal's head so that it can only move up and down between two bars. The improvements upon the stanchions have been numerous and all more or less inconvenient, but they have given very little more liberty to the captive. In our May number a chain "tie" was suggested, which had been put in use and approved itself to the writer. The common chain tie passes about the animal's neck, and slides up and down upon a post or iron rod, attached to the stall or manger. This tie is similar, except that the neck-chain is connected with two posts or rods, upon which it slides. The improvement consists in using rings upon the posts, and connecting the side-chains with the neck-chain by means of snap-hooks, attached to the central ring, as shown in the diagram. This enables one to adjust the tie to any width of stall, say from three to four feet, and have it reasonably taut. The advantage of this method of fastening cattle over any other, is, that while great freedom is given the head, so that a cow can lick both sides and lie down with her head upon either side, she has no more backward and forward motion than if she stood in stanchions, hence must drop her droppings in the gutter—if the stall is of the proper length. There is a constant tendency to give cow stalls too long a floor. Every cow should lie with her rump

AN IMPROVED TIE FOR CATTLE.

four to eight inches beyond the floor. The only objection to this is that the cows' tails will sometimes become wet from lying in the gutter. If, however, this is given a pretty sharp fall and considerable breadth, water will not accumulate and there will be no inconvenience experienced on this score.

Among the Farmers.

New Series.—No. 8.

BY ONE OF THEM.

One of my good neighbors has a small family of excellent cows which he has bred for four or five generations. They have been the especial care of an old farm hand whose heart would have been broken if he had been supplanted by another. The old man died, and the milk began to increase. The cows had very little ground feed at any time, but have been tethered on a piece of fine mixed grass and clover, the latter predominating, and at night were fed cut clover or corn fodder. The increase amounted to four to six quarts a day from three cows, none of which were fresh. There was no change in the feed, at least no essential change; but every thing now goes on like clock work. They are milked at the same hour, watered regularly, turned out and brought in on the minute, and the result is what I have stated. It is rare that one has so complete a demonstration of a fact which we all know, but to which we rarely give sufficient heed. A cow giving milk offers thus a means of ascertaining the effect of regularity and care by its increased flow. This can be conveniently measured and is almost sure to attract notice. Good results of the same kind follow a similar system of regularity and good care in feeding and watering horses, but we have no such measure.

I have often noticed, however, both with my own and my neighbor's horses, the effect of a change of hands. Poor grooming and irregularity will pull down a horse very fast, while, with exactly the same feed, good grooming and regularity will bring a horse rapidly into condition.

Who of us has not experienced the effect of irregularities of living? Many a man if he goes two hours beyond his regular meal time without eating something, will have a headache. Some persons, if deprived of rest or of their usual heverages, for example, coffee for breakfast, have their enjoyment of life seriously interfered with. No doubt similar causes produce similar results with our domestic animals, and as good digestion waits on placidity and quietude, and as milk, flesh and condition depend primarily on good digestion, breeders and feeders ought especially to study the conditions which contribute to these results.

Getting Horses into Condition.

"Condition" in horses is not fat—far from it—it is hard, tough, elastic muscle, which may be actively worked without tiring the horse, without sweating, and without exhaustion of the vital forces, unless the exercise is utterly excessive. A horse out of condition is exhausted by a half mile or a mile trot, comes in puffing and breaks out in a sweat, while one in condition returns all the fresher in appearance for having his blood stirred. What makes the difference? Proper feeding, good grooming and regular work or exercise, and enough of it. All exercise tires the muscles brought into play—a tired muscle needs feeding. The feed for the muscle is digested food. After any muscle has been taxed it is for some time in a condition to appropriate from the blood the proper elements to build itself up and increase its strength. When a horse is fed immediately before labor, the food remains undigested until labor ceases, and then is liable to do harm. All horsemen know that a horse should not have a feed of grain when warm or until he has cooled off, yet when they start a horse off to any kind of hard work or road work before his food has time to digest he is liable to be injured by it. After labor, as soon as a horse cools off and is rested, the blood, which the use of the muscles drew to the extremities, returns and is ready to take active part in the work of digestion. Then is the time to feed.

To get a horse rapidly into condition, he should be well worked or exercised according to his strength; when brought in, vigorously rubbed off and down, and when dry, cool and rested, fed. His food should be good hay when his appetite is sharpest, followed by grain (oats) which in quality

should be unexceptionable, and in quantity gauged according to the work he does. Fat will sweat off, muscle will not. A fat horse is liable to indigestion, sun-stroke, cold, flatulence (colic), and ever so many other ills, which a horse in condition is not only free from, but if properly fed, and cleaned, and worked, is not liable to get. It is usually poor economy to reduce either food or exercise.

Connecticut Farming.

I took a run up into Litchfield Co., Connecticut, a few days ago. It is always a pleasure, though an aggravation, to be whirled by rail through a well-tilled country. One gets a series of dissolving views of the farming—I wish they could be photographed. The waste lands held by speculators near the city soon gave place to land occupied by lawns and pastures, and the surroundings of the country places of business men and gentlemen from town. Then came the farms—corn, cabbage and onion fields, alternating or more or less mingling with the villas. The onion fields are a marvel of cleanly culture. Clean cultivation has involved much labor this year. Weeds have sprung up and grown on farms which are usually nearly free from them. I see every day cornfields, which by reason of the wet season, have grown more weeds than corn; in fact, some in which the corn has been choked out. Not so among the onion raisers; even the corn and potato fields were clean. On some of the fields the onions still lay in windrows, but where they were harvested the land had been smoothed off, leveled and rolled flat or plowed in ridges, and so left for the winter. Then we came into the proper milk district, where the pastures are not over-stocked and the cows were making a business of eating grass, with good roomy barns behind them, not taking exercise for a few hours, when let out of the swill-milk stables, or the sheds where brewer's grains are their chief food. And so gradually we are whirled away where real country scenes alternate with busy towns and manufacturing villages, a few dignified with the name of city—absurdly enough in some cases.

The farmers are happy in having markets at their very doors for nearly all they can raise upon their land, and their surplus is greedily sought after for the great city a hundred miles, more or less, away.

Ox Teams.

Here we come to the region of ox teams. At a little Litchfield County Fair, a few days ago, the combined "string" numbered two hundred and thirty yokes. Almost all high-grade Devons, deep red with broad white horns, broad loins, deep bodies, a beautiful sight which I was just too late to see. I greatly enjoy fine, well-broken cattle, and as part of my errand was to buy a pair, I saw several noble teams, all Devons, and so well broken and gentle that I think they could have been driven with a corn stalk, an umbrella, or a rye straw as well as with a ten-foot "gad." I found what I wanted, and was even more successful than I had hoped to be. I am a great admirer of Devon oxen, and think them the best in the world for ordinary use. True, the cross of Devon and Shorthorn are much heavier, proportionately slower and more powerful, and are very handsome; the Herefords and their grades and crosses are magnificent, but also heavier than Devons and have slower gaits and much less spirit and vivacity.

On my way home I fell in with an old friend, a farmer of West Hartford, and an old Jersey breeder. As I carried a long ox-whip our talk naturally was about oxen of various kinds.

Jersey Oxen.

My friend praised Jersey oxen to the skies. He has used them for years, and finds them docile, easy to match, strong for their weight, heavy enough, good workers and handlers, and quick feeders as beef cattle. I have occasionally seen a pair and cannot dispute him. We shall probably soon see more Jersey oxen, for the ten-dollar fee imposed by the Jersey Cattle Club for the registration of bulls, will not only cause considerable full-blooded Jersey veal and beef to come to market, but Jersey oxen will not be rare.

Useful in Every Stable.

Every farmer should be able to administer a clyster easily and promptly. The old-fashioned syringe is objectionable on many accounts. The best apparatus is a tin pipe a foot long, with a knob of solder on one end, to prevent injury to the delicate membrane. This is attached to a rubber tube three or four feet long, which fits upon the spout of a large tin funnel. The water or other fluid is poured into the funnel, and when it is held up high the pressure is sufficient to cause the dis-

APPARATUS FOR A CLYSTER.

charge of its contents. It is rather awkward to hold the funnel up, and there is danger of its contents being wasted. This may be remedied by punching three holes in the edge of the funnel, putting in wire rings, tying strings to these, to unite in a single cord, which passes over a hook, secured into a beam overhead, as shown in the engraving. By drawing the cord, the funnel may be raised or lowered at will. It is well for farmers to bear in mind the fact, that probably more horses die of flatulent colic than of any other disease, and that the prompt and free use of water, given as an injection, is, we believe, a certain cure. Three or four quarts of water is usually sufficient to give free vent to the imprisoned wind.

A Convenient Assorting Table.

An ingenious home-made apparatus, for assorting oranges, apples and other round fruit, into lots of uniform size, is shown in the engraving. It consists of a board, *a*, four feet long and eight inches wide, with a slit sawed nearly the whole length, four inches wide at the lower end, and narrowing to two inches at the upper end. This assorting device is provided with four legs as supports, two being

AN ASSORTING TABLE.

short in order to give it the proper inclination. The fruit to be assorted is placed on the board at the upper end, and rolls downward until the opening is large enough to allow it to pass into the basket beneath. To obtain a particular size, dividing boards, *b*, *b*, are placed at any point desired in the slit. Two, three, four or more sizes may be obtained as readily as one. The accuracy and rapidity with which assorting is done with this table is surprising. An inclined table, with ledges on the sides, is convenient in preparing gooseberries, cranberries, etc., for market. The fruit being poured upon the upper end of the table, will roll down, leaving sticks, leaves, etc., behind.

Wheat Rust and Mildew.

Rusts and mildews enter grain fields like thieves by night, and rob the farmer of his bountiful harvest. There is much mystery connected with the coming of these destroyers, and but little is generally known of them, excepting their ruinous effects. In figure 1 is seen a portion of a wheat leaf, three times enlarged, showing the rust in small oval spots scattered over the surface. Each one of these spots is a ruptured place in the epidermis or skin of the leaf. If a young spot, just forming, is cut with a sharp razor, and a thin slice placed under the compound microscope, we will have in view, when magnified two hundred times, what is seen in figure 2. This engraving shows one side or half of the spot. The circles at *a* show the ordinary cells, making up the substance of the leaf, and from which the skin, *b*, has been torn away by the growth of a multitude of threads and oval bodies, between them. These fine filaments are the roots, so to speak, of a minute plant, and the bright oval bodies are the "seeds." The rust plant belongs to the order of vegetation known as fungi, the more conspicuous members of which are the mushroom and toad-stools. As the wheat rust continues to grow, the skin over the upraised spots is burst off, and the multitudes of oval bodies, called spores, are exposed to view. They are of a bright, reddish orange color, and produce the characteristic appearance of the surface of rusty wheat plants. The color is not unlike that of iron rust, and the name, therefore, is well chosen. The

Fig. 1.—SURFACE OF WHEAT LEAF, ENLARGED.

bright spores are easily detached from the minute stalks that bear them. This fact is well-known by the farmer, whose clothing is quickly coated with "rust," by simply brushing against the infested grain. These spores germinate in a few hours, when provided with suitable conditions of warmth and moisture. Figure 3 shows two of these spores, *a, a*, that have fallen upon the surface of a young wheat leaf, the whole being magnified four hundred times. The spores germinate at two points on opposite sides, and the filaments grow irregularly over the surface, *b*, until a breathing pore, *c*, is found in the skin of the leaf, when they pass into the interior of the leaf. After an entrance is effected the filaments branch, and rapidly increase in length and number, at the expense of the elaborated juices of the wheat plant, and in a few days new rust spots are produced. In this manner several generations of the rust plant succeed each other. This pest is most destructive where it appears in abundance shortly after the wheat has blossomed. If a number of warm rains follow in quick succession, the growth of the rust is favored, and the grain fails to fill. The substance of the wheat plant has been stolen, and employed in the formation of countless yellow spores of the fungus.

Later in the season a second form of spore is formed in the rust spots. Figure 4 is a magnified view of a rust-spot section, corresponding with figure 2. The spores are seen to be of a different shape, being double and very dark. These are called the winter spores, and do not quickly germinate like the rust (or uredo) spores. These dark spores, when crowded in the ruptured pustules, produce the "weather stains" so frequently seen upon wheat straw, and especially the stubble. In this state, sometimes called "brown mildew," the fungus (*Puccinia graminis*), causing so much destruction to the wheat crop, passes the winter in

comparative inactivity. In early spring, the dark, microscopic spores germinate, and should the weather be favorable, the story of destruction is repeated. In one of its forms, this fungus may infest the barberry, producing countless orange spots, called "cluster cups." Recent investigations show that this form may be omitted when the barberry is not within reach. With such a pest as

Fig. 2.—SECTION OF RUST PUSTULE.

the rust plant, which does most of its destructive work before it becomes manifest, remedial measures of any kind are not easily applied.

Seth Green—His Ways and Works.

The readers of the *American Agriculturist* need not be told who Seth Green is. His fame as a master of the rod and gun, and as an enthusiastic, practical pisciculturist, is world-wide. He is a keen observer of nature in all her moods; but is especially noted for his intimate acquaintance with fishes and birds, and their habits, and the profound knowledge he possesses of the vegetable and animal life upon which they feed. Mr. Green is gifted with remarkable conversational powers, is clear and luminous in statement, and no one can listen to him without rare entertainment and instruction. He is untiring in his researches after knowledge, and has a marvellous aptitude for combining and controlling the minor and insignificant forces of nature, so that they will work together for the advantage of man. The writer was seated with him in his garden in Rochester, N. Y., one afternoon last summer, the immediate topic of discussion being the appearance of alewives in Lake Ontario, where they had been mistaken for menhaden, and had even been supposed to be a variation in the shad that had been liberated by him in the streams running into that lake. Mr. Green explained that the alewives, a salt water family allied to the shad, had reached Lake Ontario by the canals. Thirty years ago, he found them in one of the small lakes in this State, and later in Cayuga, Seneca, and Keuka lakes. He first found them in Lake Ontario in 1872. From this subject, episodes were made to the ciscos of Lake Geneva, Wisconsin, which appear in countless numbers in June, with the "sand flies;" to the rise and progress of eels, which he, with other naturalists, regards as a salt water product, a great traveller, and an emigrant from the ocean to the waters of the interior;

Fig. 3.—SPORES GERMINATING ON LEAF.

to the curious swarms of "shad" flies, or "May" flies on the St. Lawrence at Ogdensburg, and in the streams of Great Britain; and to the "sand" flies whose sudden incursion into Chicago on the last Fourth of July, was described in the *American Agriculturist* for October. After these matters had

been duly discussed, Mr. Green strolled through his garden and pointed out some examples of his special adaptations. Among his potato plants he had erected small platforms, on which, as he said, he had "taught the sparrows to eat potato bugs." First, he scattered crumbs on the platforms, on which the sparrows fed. Thence he invited them to the potato plants by scattering the crumbs on them. Then the sparrows found the potato bugs, and ate them, although we presume sparingly; since those pests are not acceptable as food. The sparrows are regarded as pests by many farmers and gardeners, and doubtless this was a case of "dog eating dog." Among his melon vines, Mr. Green had laid boards. Lifting up those boards, multitudes of toads were found concealed there by day. At night they come out and feed upon the insects that infest the melon vines. It was a simple device, and one that succeeded admirably. The toads were harnessed to his scheme of gardening, and worked faithfully and well. There is a hint in this to other growers of melons. Standing upright by an apple tree, was a tomato vine. A little weight was fastened to the tomato stalk, near the top, and the string attached was thrown over a low limb of the tree. As the plant grew, the weight dropped towards the ground, and when it grew higher, the weight was carried over a higher limb. So the work went on and the tomato vine stood up erect and bore its blossoms aloft. The fruit followed in good time. Mr. Green found thrifty potato plants growing out of a refuse heap of coal ashes in the back part of the garden, dumped there by the former occupant of the

Fig. 4.—WINTER SPORES FORMING.

house. This at once suggested coal ashes as a top dressing in his potato patch. He accepted the suggestion made by nature, and his plants showed no ill effects from a dressing which is not regarded as a means of fertilization, and which indeed is generally held to be worthless. How that experiment turned out we cannot say. It is probable that wood ashes and other vivifying agencies were mingled to a greater or less extent with the coal ashes. Mr. Green is a born experimenter, and is not slow to get at the bottom facts in the matters that attract his attention. He is not disposed to adopt the speculations or conclusions of others, except so far as they are based upon proved conditions. He has reduced to practical use, and given to the world, the results of long years of study and observation, and the world is better thereby. He is in the full vigor of industrious life, and will yet accomplish much more in the field of his special pursuits. The man who has worked so successfully for those who love the rod and gun, may be able to instruct those who sometimes despair of the shovel and the hoe.

ASHES AND MANURE.—L. H. Casselman, Carroll County, Ohio, asks: "As it is said to injure manure to mix wood ashes with it, would the effect of coal ashes be the same? How would they answer in place of dry earth, to spread under the roosts in a poultry house? How would saw-dust answer?"—Coal ashes contain only the wood ashes resulting from the wood or charcoal used for kindling, and the proportion is not ordinarily large enough to cause appreciable loss of the manure. The convenience of the coal ashes and the desirability of getting rid of them in some useful manner, make it desirable to dispose of them in the poultry house. Under the roosts ashes of any kind would be a better absorbent than saw-dust, and almost as good as ordinary dry earth.

Vegetable Soap and Horse-hair.

A plant long known to the Spanish residents of California as "Amole," grows in various parts of that State. At Monterey it is found in the pine-clad hills not far from the city, and it extends up the Sierra Nevada to near the snow line. The leaves of the plant form a cluster which spreads flat upon the ground; they are about a foot long and have wavy margins. From the centre of the cluster of leaves arises the flower stalk, some three to five feet high, according to the nature of the soil; its many branches bear small, purple-veined white flowers which, together, form a loose panicle. Though the flowers are numerous, but few are open at once, as the blooming commences at the base of the branches and gradually progresses upwards; they bloom only in the afternoon. The flowers have the general structure of those of the Lily family, to which the plant belongs; its botanical name is *Chlorogalum pomeridianum*. The engraving shows a portion of the flower cluster, behind which the leaves and bulb are indicated in outline. The bulb, which varies in diameter from an inch to four inches, is surrounded by a thick covering of brown hairs, which resemble the fibres on a cocoanut. This hair, which is eight or ten inches long, is much used in upholstering under the name of "Eureka Hair." To prepare it for use, the hair is first cleaned by a picker; after it has been steamed and dried several times, it is curled in the same manner as horse-hair, *i. e.*, by twisting it into a rope; this gives it a curl which is retained after the rope is picked apart. When dyed black this hair closely resembles horse-hair, and is used for the same purposes as that material. The finest hair grows on the high Sierras, that from near the coast being too coarse for the upholsterers. The bulb itself is used for the same purposes as soap. The Indians were acquainted with this use of the Amole; it was adopted by the Spanish settlers, and their descendants continue to employ it at the present time. In washing, the clothes are rubbed with the bulb just as if it were a piece of soap, and like that it produces a thick lather. Two other species of *Chlorogalum* are found in the State, the bulbs of which possess saponaceous properties, but are destitute of the hairy covering of the true Amole, or soap-root. It is said that the gathering of Amole gives employment to between one and two hundred persons, and that the Eureka hair exported in the Centennial year amounted to seven hundred tons.

Passages in Wire Fences.

A plain wire fence of any kind, is a barrier not easily passed without injuring it, and if the fence

WIRE FENCE PASSAGE.

be one of barbed wire, it is a problem to pass it without injury to one's self. There must generally

be to each lot a gate large enough for a team and wagon, but in a boundary fence, one is often obliged to go a long distance before finding a gate. In England, the need of a way in wire fences for foot-passengers, that should answer for such fences as a stile serves for a hedge, has led to the invention of various devices, one of which is shown in the engraving. This is called "Birkwood's Biped Pass," and, simple as it appears, it is patented in England. We give the "Pass," rather in the way of suggestion to those who would construe something of the kind, than as something to be copied.

A SOAP AND HAIR PLANT (*Chlorogalum pomeridianum*).

If any of our readers have made use of any contrivances to afford passes in wire fences, we trust they will favor us with sketches of them.

Wheat and Meat.—An Actual Conversation.

Late last September we were in the village of Spencerport, N. Y., situated on the Erie Canal and the N. Y. Central and Hudson River R. R. "What are you paying for wheat?" we asked one of the largest dealers in farm produce.—"We have been paying eighty-five to ninety cents for dry wheat; now we are paying from seventy-five to eighty cents—but it must be A 1 wheat, and dry enough to grind to bring eighty cents. The wheat we have sent to New York was graded soft, and of course we have lost money, and it makes us cautious."—"Do you ship by canal?"—"No, we send by rail. The wheat is too soft and the weather too warm to ship in boats. Millers want wheat, and there is but little coming in. Farmers are busy digging potatoes, and there is as yet little doing in wheat."—"What are you paying for potatoes?"—"That depends on the quality. Potatoes are very scarce this year. We are paying thirty-five cents per bushel for fair to good potatoes, and farmers are drawing them in quite freely."—"Are you taking in any apples?"—"Oh, yes," he said with a smile, "we are paying seventy-five cents a barrel for small barrels, and one dollar for flour barrel size. That is the situation to-day throughout this section."—"That is for early apples," we said, "what shall you pay for winter fruit?"—"It is too early to answer this question with the late kinds

of apples, but there will be the same difference in the price between the large and small barrels."

We stepped into a butcher's shop. There was a nice fresh ham on the block, and the butcher was cutting off a couple of steaks for a customer. "What are you paying for pork?"—"I paid seven and a half cents for this, and I have some coming in to-morrow at eight cents per pound. It is more than it is worth, but I paid it because I had to have it, and could not get it for less."—"What sized pigs do you prefer?"—"About two hundred pounds; and for this reason, I cut up what my customers order from day to day for fresh pork, and put down the parts that are not wanted, and in ten days I have fine 'pickled pork,' which, at this season, sells better than regular salt pork. Of course the best fresh pork is from pigs weighing about one hundred pounds, but it is rare that we can get any pigs of this size that are fat enough." The consumption of fresh meat among farmers, he said, was far larger than formerly, especially beef. Farmers do not like mutton. He bought nearly all his beef in Buffalo. Sheep and lambs, and calves, and poultry, and pigs, he got from the farmers in the neighborhood. When we came back, another produce dealer met us and remarked, "everything is cheap except meat. I have to pay fourteen to fifteen cents per pound for beefsteak. It is too high." A long freight train went past on the railroad, loaded with cattle, sheep, and pigs. This is a sight so common, that we take no notice of it. But several cars were loaded with live poultry, on their way to New York and Boston. This is something new. A few miles from the village we passed the farm of Mr. Seranton. He and two men were digging Beauty of Hebron potatoes with four tine forks, not hooks. The potatoes were sorted and barrelled in the field. He thought potatoes paid better than wheat, and the late varieties better than the early sorts. Farmers were everywhere busy at work. Stone-fences were being built, houses and barns resingled, repaired and painted, the roads were in excellent condition, and everything indicated a thrifty, energetic, and prosperous community. The low price of grain, however, must have a depressing effect somewhere. True, other things are cheap. "Everything is low except meat," expresses the situation elsewhere, as well as at Spencerport, and the conclusion is inevitable. Farmers must raise more meat. J. H.

Simple Home-Made Plant Stand.

Mr. L. B. Corey, Suffolk Co, N. Y., sends us a description of a plant stand, made in two hours at a nominal cost. Four pieces of half-inch iron rod (in this case part of an old lightning rod), had holes punched through them at proper heights, in which

A PLANT STAND.

screws two inches long were inserted into the ends of inch boards, cut to the desired length and width for shelves. The iron rods served as posts, and the whole was firm and durable, and quite pretty. As many shelves may be used as desired, or the height of the plants will permit. The stands would be improved by staining the shelves.

Shall the Walks be Straight or Curved?

If one proposes to improve his place, whether the improvement consists merely in "fixing up the front yard," or in beautifying a large estate, the plan should be well considered. Make a sketch or plan of the ground as it now is, and then mark on it the proposed alterations and improvements. The plan may be on smooth, brown paper, which

some appear finer than others, with the use of about the same advantages and materials in both."

Before we had competent landscape architects, ignorant gardeners from the old country pretended to a knowledge of the art. They were unfortunately sometimes intrusted with the laying-out of large places, and the face of nature has been sadly disfigured by their efforts. Having seen walks and drives at home, which were properly laid out with

a graceful sweeping curve, they evidently thought that the art of the designer consisted in making the walks curved, and acting on the principle, "there can not be too much of a good thing," they made some remarkable specimens in the serpentine style. Figures 3 and 4 are two illustrations of unmeaning crooks and turns, sketched by Mr. Long, from actual examples. In localities where the surroundings are formal, and large

buildings present strong architectural features, curved walks would be manifestly out of keeping. Straight walks are demanded, and they may be so treated as to contribute to the ornamentation of the plat. In illustration of this view, Mr. Long gives figure 5, concerning which he writes:

"The plat is skirted in its border by a belt of trees and shrubs, and a conspicuous circular bed of evergreens occupies a central position. This simple arrangement of neat, well-kept walks, cut into the level sward, harmonizes with the strong angular

Fig. 1.—CURVED WALK. Fig. 2.—CURVED WALKS AND DRIVES.

can be fastened to a planed board. Draw to a scale, which should be large enough to show all the objects distinctly. It will add greatly to the interest of the work, to make the plan a matter of family consultation, and encourage all, young and old, to offer suggestions as to details. It is well to recollect the Irish tailor, who, when ridiculed for the great amount of chalking he did on his cloth before cutting, replied: "Shure, and chalk is not shears." Changes are readily made upon the plan, but when the plan is carried out on the ground, alterations are difficult and expensive. In making a plan, the question will come up as to a walk or road: "Shall it be straight or curved?" The answer to this is often of more importance with a small area than a large one. A small plat, should be so treated as to make it appear as large as possible. In his volume which we shall publish in a few days, Mr. Elias A. Long says of figures 1 and 2: "When the door of the house is twenty or more feet from the entrance gate, curves may usually be introduced by having the gate not directly in front of the door, but a little to one side. Such an arrangement tends to keep the area in front of the house larger, when the walk is set to one side; as a result, the house shows to better advantage, than if the main front plat were kept smaller by a straight walk encroaching upon it. The house, in figure 1, it is at once seen, has a finer setting with a curved approach, than if the part in front of it were to be narrowed by a straight walk, as shown by the dotted lines. This principle is also illustrated in figure 2, both in walks and carriage-drives. Although here, by making curved walks, there is one more leading to the house than if they were straight; still with the foreground thus arranged, the buildings are seen to much better advantage over the stretch of lawn, embellished with trees, shrubs, and flowers (omitted in the engraving), than if the scene were cut up by the hard lines of a straight walk. The general improvement in the appearance of the grounds is also much better, for instead of increasing the angular out-

Fig. 5.—STRAIGHT WALKS ESSENTIAL.

features that exist in the surroundings—which are, it may be said, too strong to be overcome in effect, by ordinary natural arrangements. In this way is found a pleasing kind of ornamentation for the place, which it would be hard to equal by any other means. It should be observed in this case, that the walks are not so prominent or so close together, but that they convey the idea of subordination to buildings, trees, grass, and streets, hence their fitness is easily accounted for. Were the square plats between the walks filled with flowers or numerous vases, etc., instead of mostly plain grass, the fine effect would be largely lacking."

NITRATE OF SODA.—A good commercial article of nitrate of soda contains fourteen and one-half per cent of nitrogen. The price is now about fifty dollars per ton. In other words, the nitrogen costs about seventeen cents per pound. It is in an active available condition, and there is probably no cheaper source of nitrogen. Market-gardeners, nurserymen, and all others who buy manure, could unquestionably use nitrate of soda to great advantage. What the market-gardener needs is rich manure. The ordinary manure obtained from city stables and elsewhere is poor in nitrogen—especially in soluble nitrogen. Five hundred pounds of nitrate of soda used in conjunction with twenty tons of manure per acre, would often produce a better crop than forty tons of manure. We have used it with decided benefit on asparagus, onions, young cabbage plants, carrots, beets, celery, etc. Nitrate of soda is very soluble, and should be applied in small doses to the growing crop. Much will be washed out of the soil by heavy rains.

A New Pecan Nut.

The Pecan-nut has been so generally regarded as a tree belonging to a warm climate, that very few persons have deemed it worth while to attempt to cultivate it in a cool one. In the absence of any very extensive experiments in raising pecan trees in our Northern States, we have but few facts to give as an encouragement to those who may desire to plant this tree extensively for either the nuts or

Fig. 1.—NUSSBAUMER'S PECAN NUT.

timber. It may be said, however, that because there are few bearing pecan-nut trees in our more Northern States, it should not be taken as proof that this tree is not adapted to the climate. It is quite likely that most of the seedlings raised in nurseries and by amateurs, have been from the nuts purchased in our markets, or received from friends and correspondents in the Southern States, and trees raised from these would be far more likely to be tender than those gathered from the extreme northern range of this species of hickory.

If there is anything in what is called the acclimation of plants, then seedlings raised from the pecan nuts grown in Virginia, Kentucky, and Illinois, would prove to be far more hardy and better adapted to localities, still farther North than those seedlings raised from nuts gathered in the warmer parts of the South. It may be well for those who wish to try the experiment of raising pecans in our Northern States to remember this when looking for either nuts or seedling trees for planting. Nuts of the very largest size are produced by trees along the most northern range of the pecan. In fact, the largest nut that I have as yet seen, was recently received through the kindness of my old friend and veteran pomologist, Judge Samuel Miller, of Mo. This nut is correctly represented in figure 1. Judge Miller writes me that the tree bearing this nut is growing in St. Clair County, Illinois, and has been named "Nussbaumer's Hybrid," after its discoverer. The tree is a very large one, the stem measuring some two feet in diameter at the base, and is very tall, but its height has not been correctly ascertained. It is supposed to be a hybrid between the *Carya oliviformis* and *Carya sulcata*, but this is only conjecture. But whatever its origin, it is certainly one of the most remarkable as well as largest pecan nuts as yet discovered, and it is to be hoped that the owner or some one else will be successful in propagating it extensively, for such a noble and valuable variety should not be allowed to become extinct. The shell of this nut has a slightly undulating or rugose surface that rather sustains the view of its being a hybrid, and I am inclined to think favorably of this idea.

From the neighborhood of Mobile, Alabama, I have this season received some specimens of a very early as well as large variety of pecan, and figure

Fig. 2.—PECULIAR SHAPED PECAN NUT.

2 was made from a nut of a fair average size. This nut is not only early, but is of a peculiar shape, its greatest diameter being near the upper end, then tapering suddenly to a point. There are no doubt hundreds of very distinct varieties of pecan nuts, to be found in regions where this tree is indigenous, and it is time that the very best and largest were sought out and propagated in plantations of nut-bearing trees. A. S. FULLER.

Figs. 3 and 4.—UNMEANING CROOKS.

lines—strong enough already in the buildings and boundaries—by making the walks straight, we curve them gracefully, and thus induce variety in the lines. The curves are brought in such a way, that we secure that most desirable of garden qualities, breadth just where it is most needed, namely: in the foreground of the main building. This simple point is one that accounts for much of that indescribable difference in places, which makes

The New White Grape—The Niagara.

White grapes meet with a more ready sale, and bring a better price in the market than black or red varieties. A white grape, possessing all the qualities which have made the Concord so popular, has long been a desideratum among grape-growers. The Martha, a seedling of the Concord, was largely planted; the advertisements told every one "you want Martha," and it for a time had a "boom," but its quality is so indifferent, that it failed of acceptance as the white compeer of the Concord. At the meeting of the American Pomological Society in 1879, at Rochester, N. Y., there was a remarkable exhibition of new white grapes; no less than four varieties were there first placed before pomologists, their owners claiming for each all the good qualities which should make it the white grape that fruit growers had so long waited for. These new varieties have been on sale for the past two or three years, but the Niagara was offered under conditions which restricted its sale, save for vineyard planting. It is now, however, offered in open market by many nurserymen, and without conditions.

The "Niagara" originated at Lockport, N. Y., being a seedling of the Concord, fertilized, as it is claimed, by the Cassady, an old white variety. The vine is said to be perfectly hardy; it has leaves shaped much like those of Hartford Prolific, being large, thick, leathery and downy. A basket of the fruit sent us by J. S. Hubbard, Chautauqua Co., N. Y., allowed us to judge of its quality, and we have had an engraving made to show its appearance. The bunch is reduced, but a single berry gives the average natural size. The clusters are medium to large, averaging half a pound in weight, though occasionally heavier, sometimes shouldered, and compact. The berry is large, equalling or exceeding the Concord, very uniform, round or slightly oval, and clings well to the cluster; color light greenish-white, often with a tinge of amber in the sun, with a thin whitish bloom; the skin is thin but strong. In quality, the fruit is, in our judgment, superior to the Concord; its freedom from unpleasant foxiness, and the tenderness and sweetness of the flesh, make it very acceptable. The Niagara ripens with Hartford Prolific, and is said to hang without shrivelling until frost. This variety has already been planted extensively, there being over two hundred acres at Brocton, N. Y., and the accounts of its prolific character, early bearing, and freedom from disease, are well authenticated. The fruit is said to keep well; that it is an excellent shipper, the specimens that were sent to us bear witness.

Starting a Farm Garden.

A properly worked and manured farm garden improves every year. Starting with ordinary farm land, it is almost impossible to get it in the best and highest condition the first season. The chief reason for this is probably because, no matter how much manure we may use, it is difficult to get it thoroughly mixed with the soil. An eminent chemist, the late Professor Way, once said manure needed to be digested by the soil before it was in the right condition to be assimilated by the roots of plants. This may be somewhat fanciful, but at any rate, every gardener must have observed that raw land, even though it may be heavily manured, seldom gives the best results the first season.

To avoid disappointment the first season, therefore, we would earnestly recommend those who are about to start a new garden next spring, to commence preparation this autumn. If there is time for nothing more, remove all the rubbish and weeds and large stones. Plow it deep and well, and if the soil is dry enough to pulverize, put on the harrow and roller, and reduce it to the finest tilth.

In regard to the application of manure, much depends on the character of the soil, the condition of the manure, and the amount you can obtain now or in the spring. If you have abundance of manure, and the soil is rather heavy, plow under twenty or thirty tons per acre, eight or ten inches deep, and let it stay there. Then, either this fall or in the spring, work into the surface soil five or six inches deep, another good coat of manure—say twenty, thirty, forty, or fifty tons per acre, according to the crops you wish to set out in the ground.

Early cabbages will pay for the most liberal amount of manure. Late cabbages will get along with less, and so will sweet corn, beets, carrots, parsnips, salsify, and all the later vegetables. There

THE NIAGARA GRAPE.

Drawn and Engraved for the American Agriculturist.

is little probability, however, that you will get the land too rich. What we particularly wish to suggest is the advantage of good, deep, thorough plowing this fall, and the liberal use of manure either now or in the spring, or both. On light, sandy land it will probably be better to use the greater portion of the manure in the spring, and supplement it with phosphates and nitrate of soda.

The Cultivation of Onions.

Onion growing is a specialty in certain sections—principally on black, mucky land. The onions are grown year after year on the same land. In many localities, where onions were once largely grown, the crop has been abandoned, owing to the ravages of the onion maggot. This gives farmers in places where the crop is not extensively grown, a decided advantage. The maggots are not likely to be very troublesome for a few years. To those proposing to grow onions for the first time, we desire to offer some suggestions: Get the land ready for sowing in the fall. Plow it, harrow it, pick off the stones and rubbish, and work in all the manure you can. Act exactly as though you were going to sow the seed, but do not sow it until spring. Drill in the onion seed in the

spring the first moment the land is dry enough to work. There are a dozen other little matters of more or less importance, but these points, properly observed, will do more to ensure success, than the whole dozen. As to the best land to select for sowing onions, we may say that we have had good crops on light sand, and on heavy clay, and on black muck, and on soil possessing a greater or less degree of all these characteristics. Success depends much more on the man than on the soil.

Hanging Baskets.

Hanging baskets for plants are made of different materials, and in a great variety of forms. Some are formed of wire, others of clay, and ornamented with fancy mouldings, etc. Very pretty baskets in rustic style are made by covering the outside of a wooden bowl with fantastic knots and roots; this makes a pleasing basket, but we know of none so desirable as the old style of semi-globular wire basket, when properly filled.

To fill a wire basket, first obtain some of the green moss to be found on the lower portion of the trunks of trees in almost any shady piece of woods. This is to be used as a lining to the basket, turning the green side out, and entirely covering the inside of the wire form with the moss. Before filling the basket with soil, place a handful of charcoal or gravel in the bottom, which will hold the moisture. Fill the basket with rich, loose loam, such as will not harden by frequent waterings. Plants that are peculiarly suitable for hanging baskets are quite numerous, and from them a selection may be made that will please the most exacting taste. It is a mistake to crowd too many plants into a basket, if they grow they will soon become root-bound, stunted, and look sickly. If the hanging basket be of the ordinary size, one large and choice plant placed in the centre with a few graceful vines to droop over the edges, will have a better effect when established and growing, than if it were crowded with plants at the time of filling. Hanging baskets being constantly suspended, they are exposed to draughts of air from all sides, and the soil is soon dried out. Hence careful watching is necessary in order to prevent the contents from becoming too dry. If the moss appears to be dry, take the basket down and dip it once or twice in a pail of water; this is better than sprinkling from a watering-pot. In filling hanging baskets, or vases of any kind, we invariably cover the surface of the soil with the same green moss used for lining, which, while it adds

materially to the pleasing appearance of the whole, prevents the soil from drying out or becoming baked on the surface. If the surface of the soil in pots be covered with moss of this kind, especially in summer, moisture will be retained, and watering be required much less frequently.

The following is a list of the choice plants suitable for hanging baskets. Those marked thus (†) are fine for the centre. Those marked (*) have handsome foliage, and this mark (‡) indicates that the plants have flowers in addition to rich foliage:

‡ *Begonia glaucophylla* scandens; † *oxalis*; † *begonia rex*, very fine; * *fittonia*; † *cuphea platycentra* (cigar plant); † *pandanus* (screw pine); † *dracaena* (Young's); † *neiremburgia*; † *centaurea gymnocarpa*; † *geraniums*, Mrs. Pollock and Happy Thought; * *tradescantia discolor*; * *peperomias*; † *gloxinias*; * fancy ferns; † *ageratum* (John Douglass, blue); † *achyrantes*; † *variegated hydrangea*; * *ficus* *Parcelli*; † *gesnerias*; * variegated grasses, etc.

TRAILING PLANTS.—‡ *Fuchsia microphylla*; *Sedum* (stone crop); † *ivy-leaved geraniums*; German ivy; Indian strawberry vine; *Kenilworth ivy*; *lycopodium*; *moneywort*; † *trailing blue lobelia*; * *cissus discolor*; † *lysimachia* (moneywort); † *tropaeolums*; † *torrenia Asiatica*; † *mesembryanthemums* (ice plant); † *cobaea scandens*; † *pilogyne suavis*; † *lygodium scandens* (climbing fern).

Notes of Fashion.

It is very easy for a lady of good taste to be in fashion this fall, for the styles are unlimited in number, and one is at liberty to choose from an almost endless variety of fabrics, such colors and shapes as suit her own individual fancy, always remembering that simplicity is the rule for home and street costumes. Many skirts are made without any puffs or drapery. Of course these are very slightly gored, if at all, and this on the front breadth only. The fullness is all thrown to the back, where it is supported by a full tournure underneath. The back breadths should be cut longer than the others. Some dresses have a basque-front, apron-draped over-skirt, with a long, plain, princess back. Others have the back breadths in two double box plaits, reaching to the bottom of the skirt. These are set on just below the waist. Drapery is not out of place, however, and none need fear to wear last year's dresses, lest they should be "out of style." For quiet kinds of trimming, cord and braid are most used, and the still favorite vest is often formed by horizontal rows of braid, fastened at the ends by small buttons, or loops of the braid. The skirt may be trimmed with rows of braid, from a quarter to half a yard deep, finished at the bottom with a narrow plaiting. A very pretty style of cord or braid trimming, consists of interlaced rings forming a chain. Embroidery is much used, but should be of the color of the material. Beaded trimmings for rich fabrics, and for dress occasions, are very popular. There are costly and elegant passementeries in jet, and it would seem as if nothing could ever take their place for trimming black silks and velvets. There are also leaves and sprays wrought in colored beads or pearls for gayer dresses. Clasps and buckles are much used at the neck and waist-line with full vests. They are of metal, in quaint designs, and not expensive.

Bonnets are seen in many shapes, large and small, but the favorite is the small, round capote. Many have one to match each dress—but this is needless. A smooth felt or velvet, in some dark, rich shade, will look well with almost any dress. A puff of velvet all around, a cluster of loops, or bunch of feathers on the top, is all the trimming necessary. They may be with or without strings. A bow under the chin, of velvet, two or three inches wide, without ends, is becoming to almost every one. This is instead of the narrow velvet, which has been, and still is worn. Hats are not chosen by ladies of middle-age. For young ladies and children they are high, tapering to the crown, and have a narrow brim. They set back on the head a little, and are faced with velvet and trimmed with a broad twist of velvet, with a mass of loops or feathers directly in front. We here give a description of a few hats. A young lady may select a brown straw or felt, lined with brown velvet, and trimmed with shaded bronze and coral pink feathers. This is to be worn with a bronze-colored suit of cloth or silk. Another is made on a frame, and has a crown of puffed gray silk, with velvet front; the silk is dotted with red chenille, and the trimming is velvet, with a steel buckle, and a gray and red aigrette on the top. A very pretty bonnet for a middle-aged lady, is of gray felt, with a puffed black velvet edge, and gray and black tips.

For misses and little girls dark blue is a favorite color, with which is blended a rich dark-red. A blue felt hat has three or four narrow blue velvet bands around it, and a cluster of loops in front, in which are two small red wings. With this is worn a dress of plain blue, with a plaid skirt of blue and red, which is also for the vest, collar, and cuffs. A gray felt hat trimmed with rich red velvet, and white wings, is very pretty. For outside, little girls wear the long, plain redingote, plainly stitched,

or trimmed with braid or fur. A pointed hood, with a bright lining is often added. Good common sense seems now to be wedded with fashion, and health and comfort are considered. We have thick shoes, broad heels, warm stockings, and strong and well-made underwear for all ages. The days of dressing for show merely, are passed, and good, substantial garments, even if a year or two old, need not be laid aside. ETHEL STONE.

An Ornamental Slipper-Case.

Shape two pieces of heavy card-board, as shown in the engraving, one for the foundation being of

A SLIPPER-CASE.

the size required to hold the slippers, the other for the pocket, being a trifle more than half the length, and three inches wider than the first piece. The foundation is covered with felt, the part extending above the pocket being divided diagonally, and covered with contrasting colors. One half has a design in embroidery, painting, or etching in outline stitch, and the other is puffed. The pocket is similarly decorated, and is bordered with a puffing one inch and a half wide. Sew the pocket firmly to the back-board, and allow the puffing to extend over the edge. Line the case neatly with silesia.

A Cheap Home-made Secretary.

An old sewing machine frame from which the works are quickly unscrewed, is easily made to serve as a secretary and small book-case. By unhinging the cover and fastening it with two iron braces and screws to the back in an upright position, the place for books is made. To cover the holes a piece of felt may be pasted on the table part. Old frames may be purchased at the factories for a small sum, and will be found very useful with these changes.

The small drawer is a convenient place for pens, stamps, etc., and an upright piece of steel under the drawer may be sharpened to hold notes in place.

Christmas Cards Made at Home.

Beautiful Christmas cards can be made at home with little work or expense. The foundation is a cream-white card about six inches wide and four long. On the right-hand side of the card arrange a cluster of golden-rods, held in place by a narrow ribbon taken from the back of the card over the stems, then back through a second hole and tied in a bow on the back. The mottoes are painted in one color with a fine pointed brush. It is well to practise on the lettering with an extra slip before beginning on the card. The motto may be changed to suit the taste of the worker. Golden-rod dries well and keeps its color so long that it is one of the best of flowers to use for such cards. A sprig of holly is very appropriate. A small sprig of evergreen mixed with red berries is pretty. Another pleasing card can be made by using pressed ferns and pansies; the latter when pressed will keep their color well. A charming card from Scotland has a bunch of heather fastened in the center, and the word "Christmas" and date written below.

Any person who paints can make an attractive card by fringing a piece of silk five inches wide and seven long, to the depth of a quarter of an inch. On the silk is painted any design and motto that may be selected; after which it is fastened to a card a trifle larger by narrow ribbons passed through holes in the card and tied in tiny bows on the right side. Only two bows in opposite corners will be needed to secure the painted silk to the card.

A Piano Scarf.

A very suitable present for the holidays that can be made with little expense, is a scarf with crazy border, for an upright piano. Take a piece of felt eighteen inches wide and twenty-four inches longer

ORNAMENTAL PIANO COVER.

than the width of the piano. A piece of unbleached muslin eighteen inches wide and four inches deep is used for the foundation of the crazy work. On this baste small pieces of silk, satin, plush, or velvet, in any shape or size, the edges to be all carefully turned down before basting on the muslin. The edge of each piece is then embroidered with silk or floss of a contrasting shade in a variety of stitches. The pieces may be either ornamented with painting or embroidery. The greater the variety of stitches and color the prettier will be the scarf. A border of this crazy work is fastened on each end of the scarf, five inches from the edge, with a narrow black velvet ribbon, which is ornamented on each side with gold floss. The two edges are cut in points and finished with tassels or fancy balls, as shown in the engraving.

DELICIOUS LEMON SYRUP.—Cut two or three lemons in thin slices (removing the seeds) into a little saucepan with water to cover, and let them cook slowly, adding more water as the first boils away. When the slices are tender, take them out and add white sugar enough to make a syrup of the juice and water, and simmer until it thickens.

How to Dress the Christmas Tree.

The following suggestions are equally adapted to a large tree intended for a school entertainment, or a smaller tree at home. First select a tree of a suitable size, and good shape. Place it firmly in a tub, keg, or bucket, by nailing several wooden braces across the tub from side to side, close to the trunk of the tree, and filling it with sand, stones, or bricks. Cover the top of this base with moss, or bits of evergreen, and wrap a piece of bright-colored cloth around the sides of the tub or keg.

Various kinds of pretty ornaments for Christmas trees can be bought at the shops, but very good ones may be made at home for a trifle. The decorations must be showy and bright, but need not be as neatly made as if they were to undergo close inspection. Cranberries and popped corn strung on a thread, and looped from branch to branch, are quite effective. Chains made out of gold and silver paper, are used in the same way. Cut a number of ovals about two inches long, and remove the centers to make rings. Join these into a chain by slipping a narrow strip of paper, three inches long, through two rings, and gluing the ends together. Join on another ring with another strip of paper, and so on. Cut out of card-board as many stars, crescents, and "butterflies" as will be needed, and twice that number out of gold and silver paper, and paste the latter on each side of the card-board. Pass a black thread through a point of the stars and crescents, and tie in a loop, by which it is hung on the tree. Out of blue, yellow, white, and red tissue paper, make tassels by cutting the paper into tiny strips. Fasten a bunch of these to the "butterflies," by passing a cord around both. Small candles, for lighting up the tree, may be fastened in place, when the regular candle holders are not to be had, by bending a small-sized hair-pin over the branch, points up, and pressing the candle down on the pin. The work of ornamenting the tree can be done by the whole family, but the presents should be given to a person of decorative taste and skill to hang in place on the tree.

An Inexpensive Table-Cover.

A very handsome table-cover, a corner of which is represented in the engraving, can be made at a small cost. A square of some rich shade of felt

SEGMENT OF A TABLE COVER.

is used for the body. The border is formed of velvet or plush. As the pieces used are very small, discarded bonnet or dress trimmings, carefully

brushed and steamed, will answer as well as new material. The darkest shade in the engraving represents black velvet, while light and dark well-blended colors should be used to fill the smaller spaces. Care should be taken in sewing the pieces together, and afterward basting them on to the felt, leaving a border of three inches on the outside. The seam should be "feathered-stitched," with gold-colored floss. The fringe upon the border is made by cutting the three inches of felt along the edge into small strips one-quarter of an inch wide. The table top should not be larger than the body of the cover, so that the border of contrasting colors,

A GROUP OF CHRISTMAS DECORATIONS.

with the fringe beyond, will neatly hang in sight, and produce a handsome and pleasing effect.

Christmas Decorations.

Above we present several new designs for Christmas Decoration. The foundation for the Fan is pasteboard, made to represent an open fan, by cutting it in large points on the edge. Draw a pencil line from the center of the fan (where the bow is seen) to the upper and lower end of each point. Two shades of green are needed to give it the desired effect; sew the lighter on the left side of the points, and the darker on the right; this will make it look like an open fan. Fasten on a spray of bright red berries and a large bow of red ribbon at the bottom; they can be made large enough to fit over the top of a door.

The Parasol is also formed of pasteboard. Cut the pieces out, guided by a parasol, and overhand them together. Sew the green on with a few herries scattered over them. Use a rustic stick for the handle, and cut a hole in the top of the parasol, allowing the stick to show several inches above it; fasten it in securely and finish with a large bow of bright ribbon tied on the handle.

Pressed ferns may be used for decorating lace curtains. They are kept in place with pins which can be easily concealed, and the ferns do not look as stiff as when sewed on. Use large ferns for the center of each curtain, grouping several together, and tie with scarlet satin ribbon. Tack a few branches of pine and holly over the window.

The Work Bag, made of a hat, will be found useful and ornamental. A soft straw hat with a rolling brim will answer the purpose best. Cover the hat smoothly with silk or satin inside and out. A piece of pasteboard cut the size of the crown is

covered on both sides with silk and finished on the edge with a silk cord attached to one side of the hat. Make a loop on the other side to fasten it in place in the hat, and sew a stripe of narrow ribbon on the crown, making several places for slipping in scissors and other sewing utensils. Sew a straight strip of silk on the inside of the crown to form a bag; shirr it at the top with ribbon left long by which to hang it. Palm leaf fans gilded and ornamented with holly or mistletoe look very pretty and help to decorate the home.

A Cow Bell, suitably decorated, makes a hanging ornament for the chandelier. It can be gilded or left the natural color. Hang it with a broad ribbon.

A Sachet Bag is a neat and easily made little present. Two shades of satin ribbon are cut eleven inches long and sewed together within an inch and a half of each end. Cut the ends in points and baste a piece of lace two inches wide in the top of the bag. Make an inner bag of several thicknesses of cotton sprinkled freely with Sachet powder, slip it in the ribbon bag and tie it together at the top as seen in the engraving. Place a bow of many loops and ends on the point.

The Book Marks are made of pasteboard covered neatly with satin with a spray of mistletoe and holly painted on them. Cut a round hole in the top of them, work it around in button hole stitch, and tie in a narrow satin ribbon. Those are fortunate who, in the season dried flowers, ferns, etc., have gathered a good supply, in anticipation of the demand for them at the approach of Christmas. Some of the ferns are evergreen, and these may still be collected and dried, by pressing them

between papers. The Climbing, or Hartford fern (pressed), is kept for sale by many florists.

Birch Bark Panels.

Take a strip of canoe or paper birch bark and split it until the pieces are very thin; cut from one of these papery strips a little figure, of Kate Greenaway style, or any Mother Goose character, desired. Paste the figure carefully on a panel of black card-board, and with pen and ink draw the few lines necessary to designate the arms, dress,

BIRCH BARK PANEL.

etc. A few strokes with a paint brush to represent grass at the feet of the figure are all that is necessary. If the bark is hard, soak it in water before splitting. Mount the card on an easel.

The Doctor's Talks.

A long time ago I showed how some of the tricks of the so-called magicians are performed. Since then I have had several letters asking for more of these tricks. An exhibition of magic, "sleight of hand," or conjuring, as it is called, is very amusing; we see all sorts of impossible things done before our eyes, and though we know that our senses are deceived, the deception is performed so neatly, that we are at a loss to see how it is done. Most of the conjurer's tricks are performed by the aid of ingeniously contrived apparatus; the various boxes,

Fig. 1.—A KNIFE THROUGH THE WRIST.

cans, jars, etc., he uses in his strange art, are all made to help the illusion.

A KNIFE THROUGH THE WRIST.

The trick of passing a knife through the wrist, will show how very simple some of the deceptions are. The magician shows his arm, with a large knife passing completely through it, as in figure 1. If you were to see the knife, it would no longer be a matter of wonder. The knife is cut in two, and the parts connected by means of a curved spring, as in figure 2. By means of the spring, one-half of the knife is held above the wrist, and the other half directly below it, the knife appearing to the eye exactly as if it passed through the arm. Other

Fig. 2.—THE KNIFE.

tricks, equally surprising, are performed by the aid of devices quite as simple as those mentioned.

DRAWING LIQUID FROM THE FOREHEAD.

This trick could be performed by two persons, for the amusement of a gathering of young folks. One who undertakes to perform any trick should be perfectly cool and self-possessed, and be a good

Fig. 3.—LIQUID FROM THE FOREHEAD.

talker. This trick requires two boys, who should rehearse their parts beforehand. One boy, whom we will call George, performs the trick, and Charles acts as his assistant. George attracts the atten-

tion of the company by saying to the other: "Why Charles, what on earth makes you look so pale, what is the matter with you?"—Charles.—"Yes, something is the matter, I feel very badly."—George.—"What have you taken?"—Charles.—"I saw in the next room a bottle which I supposed might be some refreshment, and I—I tasted of it."—George.—"What! a bottle on the shelf?—Mother's hair tonic! Oh, Charles, why did you! It will at once fly to your head, and give you collywobbles of the brain."—Charles.—"Oh, what shall I do?—what shall I—do—oo—oo."—George.—"Sit here, and I'll relieve you at once."

Fig. 4.—THE FUNNEL.

George goes out and returns with a big awl and a glass in one hand, and a small funnel in the other. He asks one of the company to hold the glass, makes Charles bend his head over, and at once plunges the awl into his forehead. Then asking the holder of the glass to bring it to the proper position, applies the funnel to Charles' forehead, and a quantity of dark liquid runs into the glass.—George.—"There, Charles, how do you feel now?"—Charles.—"Better, much better."—George.—"A walk in the open air will quite restore you, come." This gives George a chance to remove his awl and funnel before the others examine them. The trick, when well done, is very puzzling, the awl appearing to enter the forehead, and the liquid to run from the wound. The awl, as seen in figure 3, is so arranged that with a slight pressure upon its blunt point, it slips into the handle. When pressed against the boy's forehead, it appears to enter the skull. The funnel, figure 4, is a double one. Such funnels are sold by dealers in magician's implements, and can be made by a tinman. A funnel is placed inside of another, with a small space between the two. Molasses and water, or other colored liquid is placed in the space between the two funnels; there is a small air hole connecting with this space, just where the handle is attached. As long as the thumb is kept over this air-hole, the liquid will remain in the space, but as soon as the hole is uncovered, and air allowed to enter, the dark liquid will run out and should be caught in the glass.

Christmas Surprises.

If Christmas presents are not too numerous it is a good plan to prolong the pleasure by a few unexpected surprises. In one family we know of, the gifts are hidden in out-of-the-way places, and there is a grand game of "Hide and Seek" on Christmas morning; and great fun when the articles (which are labeled) are discovered, and delivered to the rightful owners.

The Treasure-Loaf, is a novel Christmas-box for the mother of the family. To make this, take a loaf of bread well browned, and with a sharp knife make a deep incision and work the knife round until you can lift off the lower piece entire. Scrape out all the soft part within, only leaving the crust. Wrap the gift in paper, lay it in the hollow and replace the removed portion, which must be secured in place with flour paste. Then set the loaf in a hot oven for a few moments to brown the under-side, and when taken out rub the joined places with sand paper; no one will suspect from the appearance of the loaf that it has been opened, until the present is discovered.

The little ones will appreciate the Christmas snowball. Construct a framework of whalebones, in two-halves, a yard and a half in circumference. There should be four or five strips for each half, joined together at both ends and bulging in the centre, to give a circular shape; cover these with paper and then gum on white wool or cotton. Fill the ball with the gifts, and fasten it together lightly, so that it will readily fall apart. It will cause great merriment when this "Santa Claus" snowball comes rolling in on Christmas morning, and afterwards falls into many pieces.

An Old Puzzle Improved.

The task of making a plug that will exactly fit both a round hole and a square one, is by no means a new puzzle. The addition here made to it is quite new. A thin piece of board has a circular and a square hole, and a third in the form of a letter T, or an incomplete cross. The puzzle is, to so shape one piece of wood, that it will neatly fill all the openings. In order that the task may be accomplished, the three holes should bear a proper proportion to one another. The sides of the square hole should be of the same length as the diameter

of the circle. The top part of the letter T should be the length of one side of the square, and from the upper side of the cross-piece to the lower end of the upright should be the same length. The shape of the block, or plug, may be found after a few trials. If given this plug ready made, many persons will be puzzled to make it fit all the holes.

The Rock Kangaroo.

The books often speak of the Kangaroo, as if there were but one. There is in Australia, besides the Great Kangaroo, another, named from its habits, Rock Kangaroo, and the Tree Kangaroo in New Guinea. The engraving represents the Rock Kangaroo, which is only about half the size of the common kind. It has a brush of long hairs at the

THE ROCK KANGAROO.

end of its tail, on which account the Australians often call it the Brush-tailed Kangaroo. The general color of the animal is a purplish-gray, the chin and underside of the throat are white, with

other white markings on the under parts. This animal is only found among rocks over which it runs with great agility, and climbs steep precipices with the ease of a monkey. The Rock Kangaroo hides among the crags during the day, and as it rarely ventures out save at night it is rarely met with, except by hunters, who seek it in its rocky hiding places, for the sake of its flesh, which is highly esteemed. Its fur, though long, is harsh to the touch, and is not much valued. The Tree Kangaroo is a native of New Guinea. Its fur is black, and resembles that of the black bear. This animal climbs on trees, and plays among their branches with all the agility of a squirrel, and is said to look singularly out of place in hopping about in the branches of the tall forest trees.

Each of the enclosures represents a word, all four of which, when written in the order given, one over the other, will read the same across and down.

Wing Foo's Christmas Tree.

AGNES CARR SAGE.

"Pig-tail! and almond eye! catch a Chinnee on the fly!" sang, or rather roared a party of rough lads, who, armed with sticks and stones, came rushing pell-mell down the street, in pursuit of a terrified, overgrown Chinaman, who, with his shabby black gown fluttering in the cold wind, and his queer little flat hat dancing up and down like an animated pan-cake upon his head, was making wild leaps over the frosty pavement in his effort to escape; suddenly his foot struck on a glare of ice, he slipped, measured his length upon the sidewalk, and in an instant his tormentors were around him. "Now then, Charlie, we have you," cried one. "No more washee, washee for you."—"We won't have such pussy-cat heathen walking round the streets at Christmas," added another, at which the rest all laughed and shouted, "No more we won't! let's cut off his pig-tail."—At this the Mongolian's eyes began to roll wildly, and he clasped his hands tightly over the little black braid of hair, wound in a snug coil on the top of his head, while he feebly gasped, "No, no, bad Melican boys, no cuttee pick-tail." To lose his queue, is an irretrievable disgrace to a Chinaman, and without it he can never return to his own country. But these cruel young street Arabs were relentless in their sport, and after making fun of the poor laundryman to their heart's content, the one who appeared to be the leader of the band, drew forth a knife, and in spite of his victim's piteous squeaks, was about to put his threat into execution, when round the corner, and dashing into their

midst, came a sturdy, bright-eyed news-hoy, who, regardless of the evening papers that flew from beneath his arm, snatched the knife from the young rough's hand, exclaiming indignantly: "Aren't you ashamed of yourselves you mean cowards? to attack a poor creature like that! Why don't you take a man of your own size?"—"See here, Jim Connel, we won't have you spoiling our fun," spoke up the leader, "so just hand back that knife, and mind your own business."—"I won't, and you shan't hurt the John Chinaman either."—"Then look out for yourself," and stones and sticks began to whistle through the air, while the whole mob fell upon him, and it would have gone hard with him, if a policeman had not suddenly and unexpectedly appeared upon the scene. With a cry of "the cops! the cops!" the besieging party beat a hasty retreat, leaving the Chinaman rubbing his bruised head, and gazing ruefully upon his protector, who, at the last moment, had been struck by a flying missile, and fallen upon the pavement.

"Oh! he gettee hurttee! poor good Melican boy gettee hurttee," moaned the Mongolian, while the policeman laid a heavy hand on the boy's shoulder, saying roughly, but kindly, "see here, my little man, what is the matter?"—"Nothing," replied Jim sturdily, "only a stone hit my leg, it will be all right in a minute." But in attempting to rise, he turned deathly pale, and sank back, almost fainting away.—"Broken, I am afraid," remarked the policeman: "there, don't try to move, and we'll carry you home, or to the hospital, whichever you like."—"Home, home to granny's," said Jim, "but oh! my papers! they are all spoiled!" And sure enough, they were sadly torn and trampled, nothing but scraps remaining, which, however, the Chinaman was gathering up with the most assiduous care.—"Wing Foo so sorry, so velly sorry," he stammered in his Pigeon English, as he piled up the crumpled bits by the boy's side.—"Never mind, Charlie," said Jim, cheerfully, though he had to bite his lips hard to keep from crying. "It was a mean trick they were playing on you, and I'd do as much again."—"You're a brave chap, and a good one," said the protector of the peace, "and those young rascals ought to have six months on the 'Island' for this; but here comes the ambulance, and we'll have you home in no time."

It was a sad little procession that followed the ominous black coach to the poor but neat tenement where Jim lived with his grandmother and younger sister; for many of his boy friends had gathered round the scene of the conflict, and followed in the wake of the ambulance, Wing Foo, being chief mourner, with his yellow features expressive of the deepest despair.—"Oh! me poor h'y! me poor b'y!" wailed the old Irish grandmother, as Jim was carried in. "Sure, and its the sorry home coming ye have this day, and all for a miserable haythen, too," while pretty little Nora hid her face in her apron, and sobbed as though her heart would break. In fact, Jim was the gayest of the party, and tried hard to joke and smile, though his face was white, and he gave a long sigh of relief as they laid him on his little bed. A doctor was quickly summoned, who set the broken limb, assuring him that it would be all right in time, though he would have to lie quiet for several weeks, at which he looked very sober, and Nora exclaimed, "Oh! then he will lose all the Christmas fun!"—"I am afraid he will, unless it comes to him," said Dr. Hollis, nodding good night, and turning to descend the stairs. At the bottom he stumbled over something curled up in a heap, and a piteous voice asked, "Can medicine man make good boy all rightee again?"—"Hallo! who is this?" cried the doctor. "Ah! the Chinaman, I suppose, who caused all the trouble. Yes, Jim will be himself in time, if the bones knit well. He has been asking for you."—"Me goee see him," and ascending the stairs, Wing Foo knocked at the door, and was admitted by Nora, although rather reluctantly, while the grandmother's cap border quivered angrily. But Jim called, "come in Wing Foo, or whatever your name is, and see that I am not quite killed after all."—With cautious step the poor fellow approached the bed, whispering,

"Is good boy velly sick?"—"No, but the stone knocked my Christmas in the head, and I mind that more than my leg, though old saw-bones has made it ache bad enough, dear knows, for to-morrow is Christmas eve, when they are to have the festival in the Mission School, and I wanted to see the Christmas-tree so much—but now I can't," and tears filled the boy's brown eyes as he thought of the beautiful evergreen, decked with lights and glittering balls, and of the carols he so delighted in singing.

Wing Foo's scanty English was not sufficient to express his feelings, but he nodded and grunted, and looked so wretched, that even Mrs. Connel's heart softened towards him, and she muttered under her breath, "Poor haythen, he can't help looking like a rat I suppose, and Jim did right not to let him be murdered," for she had much more of the brogue than her grandchildren, while blue-eyed Nora smiled sweetly upon him, and held a candle to light the way, as he shuffled down the dark stairs, and then he sadly weeded his way to his home in Mott Street.

It was Christmas eve, cold, clear, and frosty; the streets redolent of the sweet, spicy odor of pine and hemlock, and gay with a happy, bustling throng; the holiday gladness showing in every face, while above, like a thousand Christmas tapers, the quiet stars twinkled and gleamed as though they knew it was the eve of the Nativity. But the joy of the happy Holy season seemed not to have reached the little tenement in Baxter street, although womanly Nora had done her best to make it look bright and "Christmassy," as she said, by polishing the furniture until it shone, building up a roaring fire, and hanging a bunch of holly, gay with scarlet berries, over the mantel. The grandmother's wrinkled face wore a troubled look as she prepared some toast and tea for the invalid, and Jim was restless and feverish, for all day long his busy brain had been trying to plan how they should live during the coming month, for he well knew that the loss of his earnings would be a serious matter in the little household.—"The boys will soon be gathering now in the big school-room," he remarked, breaking the silence that had fallen upon the trio. "I wonder if they will miss my voice in the carols."—"Of course they will," said Nora, "for did not Mr. Goodman say yours was the clearest and sweetest of them all."—"Sure ye sing like a thrush," said the old grandmother, "and it's the rare pity that ye won't be there; but as ye can't, why faith! think no more about it, me darlint, but jest ate this bit of toast and take a cup of tay. It will cheer ye up loikes." Thus urged, Jim tried to eat his supper, but his heart seemed to be in his throat, and every mouthful choked him, as he thought of the merry-making in which he should have no share, until at last, worn out with pain and disappointment, he broke down completely, and pushing away his plate, sobbed, "Oh! granny, I can't, I can't, I thought this was going to be such a lovely Christmas, and now it's the most miserable one I ever knew."—It was so strange to see light-hearted Jim in tears, that Nora cried too from sympathy, and the old lady wrung her hands, exclaiming, "Oh! whatever shall I do? whatever shall I do?" when, as though in answer to her question, there came a gentle knocking at the door, and she opened it to see standing on the threshold no other than Wing Foo, dressed in holiday attire, his funny little black eyes twinkling like two jet beads, his slit of a mouth stretched from ear to ear, and bearing in his hands a square box covered with red paper, sprinkled with Chinese hieroglyphics, in which was planted an evergreen hush, hung with the most curious medley ever gathered together on one small Christmas tree.

"Melly Klissmas!" he said, with a low bow. "Goot Melican boy 'save Wing Foo's pick-tail. Wing Foo bling boy Klissmas tree," and in he marched, and set his gift with much pride and ostentation on the little stand by the newsboy's couch.—"Oh! Wing Foo! how funny and how jolly of you!" cried Jim, sitting bolt upright, while smiles chased the tears from his face. Nora burst into peals of laughter, and the Mongolian nodded and grinned

with delight.—“Sure, and he behaves like a Christian if he is a haythen,” said Mrs. Connel, putting on her spectacles to examine the Chinese Christmas tree, and truly, it was a strange and wonderful work of art, over which they all grew merry. Gay with scraps of bright-hued paper, and strung with festoons of red and yellow fire-crackers, here and there were hung sugar toys, Chinese moon-cakes, tiny lanterns and banners, and strangest of all, several dead mice, swinging back and forth by their slender gray tails.—“Why! Wing Foo, do you take me for a cat, that you bring me mice to eat,” laughed Jim.—“Flied mousey velly nice,” said the Chinaman, smacking his lips, regardless of the horrified looks of his listeners. “Chinamen eat

I come in?” and they looked up to see a pleasant-faced gentleman, Jim’s Sunday school teacher, beaming upon them.—“Oh! yes, indeed Mr. Goodman. I am so glad to see you,” cried Jim, blushing with pleasure.—“And I am glad to see you so merry, for I just heard of your mishap, and I stopped in on my way to the school, fearing to find you rather unhappy.”—“So I was,” said Jim, looking rather ashamed, “snivelling here like a regular baby until Wing Foo came with his presents to cheer us up. Just see the Christmas tree he has made me.”—Mr. Goodman was as much pleased, and interested as the children could desire, laughing heartily at the funny mice and hard moon-cakes, but declaring it to be the most original

and Japanese bric-a-brac. He begged permission to examine more closely the strange little gods and curious heasts, many of which, he said, were of the most exquisite workmanship, and having finished his inspection, turned to Mr. Goodman, saying: “The Oriental has made your young friend a really valuable gift; some museums would pay a large sum for this collection, and I will gladly give fifty dollars for it, if the boy cares to sell.”—“I will certainly ask him,” said Mr. Goodman, with a look of pleased surprise, and having added to the little tree several cornucopias of candy, and a beautiful little waxen Angel, that hovered caressingly over the hideous, black Josh, like the Christmas spirit of peace over a sinful world, carried it

BIG WING FOO IN DISMAY.—(See page 551).

Drawn and Engraved for the American Agriculturist.

him every day.” But besides these delicacies there was a wonderful variety of curious little figures, carved out of wood and ivory, as only the Chinese can carve, and brought from the land of tea and chop sticks by this poor child of the East, who spent his days in an underground laundry. Beneath the tree sat a funny black “Josh,” with a humped back and sprawling paws; rabbit-eyed ladies promenaded the larger limbs, while the smaller twigs were hung with odd Chinese animals and birds of all shapes and descriptions; while on the very top, in place of the regulation St. Nicholas, a comical little mandarin, in full regalia, nodded his head continually, as though in grave welcome to all.

How they “Oh’d” and “Ah’d” over each and every thing, while Wing Foo was the very happiest Chinaman in all New York, and when the wonders of the tree were exhausted, drew from beneath his robe gifts for both grandmother and Nora, a small package of the choicest tea, real Orange Pekoe, and an immense fan, painted in gorgeous colors.

They were just at the height of their merriment, and Jim had struck up one of his favorite carols in which even Wing Foo joined, singing with all his might and main, “Glather aloud the Klissmas tlee,” when a cheery voice asked, “May

Christmas tree he had ever seen, and when he was obliged to depart, asked permission to take it with him, to show the Mission boys what a poor, ignorant Chinaman could do to express his gratitude.—“As for you, my dear lad,” he said to Jim, “I consider you a young hero, and am much pleased and very proud to have one of my boys thus defend the weak and helpless, especially if they are strangers in a strange land.” At which praise from his beloved teacher Jim felt repaid for all he had undergone.

The long school-room belonging to the B—street Mission was crowded with happy, expectant boyish faces, and three hundred young voices were singing “Hallelujah! Hallelujah! in the highest!” when Mr. Goodman entered and made his way to the platform at one end. As the carol ended he addressed the school, and the subject of his discourse was, “Wing Foo’s Christmas tree.” He was a bright, entertaining speaker, and many a heart was stirred with a desire to do likewise, as he told in a few eloquent words of the newsboy’s bravery and heroism, and how it had been rewarded. The little tree almost threw the big one into the shade, and attracted special attention from some gentlemen visitors that were present, one of whom was a connoisseur in Chinese

back to Baxter street, where he found Jim wide-awake, eagerly awaiting his return. He opened his eyes in amazement when told of the gentleman’s offer, and gladly accepted what seemed to him a fortune, and which would make them all more than comfortable while he was confined to the house, only stipulating that he might be allowed to keep the funny nodding mandarin, which he declared was the exact image of Wing Foo.

So the Connel’s Christmas was a right merry one after all, for Jim sent Nora to expend the first of his fortune in a fat turkey for dinner, while granny concocted a big, brown plum pudding, that came to the table adorned with a sprig of holly, in real old English fashion, greatly to the astonishment of Wing Foo, their only guest. The poor Chinaman was highly pleased with the invitation to dine, and although he used his knife and fork like chopsticks, seemed to enjoy himself hugely, and when the feast was ended, drew extensively upon his small stock of English words to express his satisfaction, by rising in his chair, and declaring with many nods and genuflections, “Melican man’s Klissmas splendiflous! first late! pooty good! Feast of candles better than feast o’ lanterns! Wing Foo makee one Klissmas tlee ebely year.”

Profitable Employment for Boys and Girls.

If every boy and girl who would like to earn money for themselves during the coming months, or would like to secure presents for themselves or their friends, will send their address to us on a postal card, they will immediately hear of something to their advantage. In writing us, please give your address in full, and direct to "The Doctor," *American Agriculturist*, 751 Broadway, New York City."

A Beautiful Christmas or New Year's Gift.

A beautiful Christmas or New Year's gift for any one of your friends, is the elegant Family Cyclopædia. In renewing your subscription for 1885, if you do it immediately, you secure this Cyclopædia as a present from us, and then you can present it to some one else on Christmas or New Years. Then in addition you can secure any number of articles in our beautiful Premium List, by procuring and forwarding us subscribers.

Our Gallery of Dogs.—Poodles.

The Poodle is essentially a German breed of dogs—introduced into that country in the latter part of the sixteenth century, and has ever since been a growing favorite with all classes. Two kinds of dogs are known among us as Poodles, namely, the German, or true Poodle, and the French Poodle. The latter is a diminutive, useless, lap-dog, with white, silky hair, forming a copious mop about the head, neck and shoulders, the body and hind quarters usually being closely shorn. The delicate little creatures have their faces usually stained and defaced by a running from the eyes, which are prone to be weak and unattractive. These are not akin to the

Mr. Joseph Harris in the Far West.*

Editorial Correspondence.

Charley and I started for the West, Thursday, Oct. 16. From Rochester to Buffalo we were on familiar ground. At Buffalo, we took the Michigan Central R. R., and turned back our watches one hour. From Buffalo to Niagara Falls we pass along the banks of the Niagara River, over a rather stiff soil, largely occupied with apple orchards, many of them in grass or clover. Some that were occupied with corn, had a healthier, larger, and more luxuriant foliage. Charley bought a novel on the cars and was reading it. I told him we were now approaching one of the wonders of the world. I have seen Niagara Falls many times, but they are always new. And in fact, the oftener you see them, and the longer you look at them, the grander they become. The cars passed rapidly over the new cantilever bridge. Formerly, in passing over the Suspension Bridge, the train moved with a slow, solemn, and cautious motion, but now we go merrily over, and stop on Canada soil. A courteous Custom House officer passes through the cars, and inspects our unchecked baggage, and we pass on, stopping a few moments where a fine view of the Falls is obtained.

Then, "all aboard," and on we go. We are soon at Welland, two hundred and thirteen miles from Detroit, and cross the Welland canal. "Put down that novel, Charley," I said, "and look at this great ship canal that connects Lake Erie with Lake Ontario." Charley looked. There was not a boat in sight, and he soon turned to his novel again. I let him read in peace. We pass through a fine farming section. Fences, crops, houses, barns, cattle and sheep, all indicate good land and good farming.

At Windsor, the cars are run upon a large steamer and carried over to Detroit. The river is brilliant with electric lights, and the whole performance, if not so common, would strike one dumb with wonder and awe. Many of the passengers quietly sleep through it all in their berths. It is an old story to them. And we too, soon turned in, and knew nothing more until we were approaching Chicago. We had to get across the city.

A GROUP OF POODLES.

Engraved for the American Agriculturist.

German Poodles, which are in every way a superior breed of dogs. These are above medium size, of either white or black color, and of great activity, vivacity and intelligence. In fact, it is claimed for them by many, that they surpass all other breeds in intelligence, and this is in a measure corroborated by the fact, that the most remarkable trick-dogs of the shows are usually German Poodles. When we add to these qualities a certificate of the highest canine character, a depth of prompt obedience, fidelity, confidence, and affection, really remarkable, we can hardly say anything more in their favor. As to breeding, the two colors are kept separate, the white being bred pure, but in the black a patch of white on the breast is admissible; in both the nose and nails are black. Besides this distinction by color, another is found in the character of the hair, which in one breed is marked by glossy and tight curls, in the other it is woolly, not separating into distinct curls, but light and flocky, like locks of wool. If the hair of the common short-haired breed, described as forming close curls be allowed to grow, it forms ringlets, which are more curious than beautiful. The accompanying engraving shows well this interesting breed of dogs.

Omnibuses were provided for passengers, and everything convenient. Our baggage was checked through, but we had a hand satchel, two guns, and a dog, to take along. We got into the omnibus, and "Dash" came in too. A man who had been smoking freely the night before, and was cross in the morning, with a glance at the rest of the passengers, growled at the dog, and said he had no business in the omnibus. Dash is a well-bred, gentlemanly, handsome dog, and he glanced up modestly at a well-dressed young lady, and she patted him on the head and spoke kindly to him. He recognized her as his protectress, and "charged," hiding himself from the snarling man in the corner, and all was well.

Cities oppress me. I did not come West to see cities. I have seen them before—London, Paris, New York, and Chicago. They are all pretty much alike. I am aware that Chicago in some respects is ahead of the other great cities of the world. But we will not tarry.

Leaving the Garden City.

We left Chicago at 11.30 A. M., on the C. & N. W. R. R., and are soon breathing the free air of the country again. For some miles out, agriculture has a market-gardening aspect. But not as much so as I should have expected. Asparagus and beets were good; onions and turnips poor. In the Chicago market, a man wanted to

sell me a harrel of very poor, dried-up red-top strap-leaf turnips for a dollar. An agricultural editor in Chicago told me, that Western farmers did not want Eastern agricultural papers, and he intimated, that the best thing I could do was to turn back, and go home again. Western people, he said, laughed at the remarks of Eastern editors, "Eastern farming was chemical, Western farming mechanical." What nonsense! Two hundred pounds of superphosphate per acre would benefit turnips on this rich-looking prairie soil as much as on my own farm, and pay equally well or better. If that is chemical farming, the market gardeners of the West will soon adopt it. The fact is, the West wants and will have the best of everything. On this very train on which we are now traveling, there is a dining car elegantly fitted up, where you can sit down at a table and comfortably and quietly eat at your leisure, as good a breakfast, dinner, and supper, as you can get at the Continental Hotel in Paris, far better than you can get at the Langham in London, and while eating it you are speeding on through a country whose agriculture is to be purely mechanical! I do not believe it. In going from Liverpool to London, we got a "basket-lunch" at Leicester, and ate it in the car. I thought this very fine. We ate our chickens at leisure, and pitched the bones through the window. But here we have venison steak, broiled chicken, mutton chop, tenderloin steak with mushrooms, potatoes, beans, cauliflower, celery, fruit, dessert, etc., etc. And "Dash" in the baggage car got as good a dinner of scraps as he could get at home. The West will have the best breeds of horses, cattle, sheep, and hogs; the best implements and machines, and she will adopt the best methods of agriculture and horticulture. Farming is now and ever will be more or less mechanical, but there is no reason why it may not be chemical also—certainly Western agriculture will be in the best sense scientific. I am not afraid of the Western farmers laughing at me, but if they do, I am good-natured enough to stand it.

Looking through the window, we see a man digging potatoes with a sort of double-mouldboard plow. On this light prairie soil, it seems to do good work. In the same field is a patch of Long Red Mangolds—not as good as such rich-looking soil would seem capable of producing. Probably the Yellow Globe would do better. Small patches of corn, and large patches of weeds are not uncommon. More yellow pumpkins are grown in the corn than with us, but they are no larger.

Chicago to Winona.

"Where are we going?" asked Charley. "Get the map and look it up. We are going from Chicago to Winona, Minnesota, and from thence west of the Mississippi River into Dakota."

West of Harvard, Charley began to get interested in the country. He has never seen the prairies before. I suppose a Western farmer will laugh at me for calling them prairies. They were once prairies, but are prairies no longer. On the right hand, and on the left, are large fields of corn, and good corn; large pasture fields, and a hundred head of cattle in a herd. Here is a ditch, about eighteen inches wide, and two and a half feet deep, its straight sides, no wider at the top than at the bottom, show that it was dug with a ditching machine.

At Caledonia, we pass some splendid fields of red clover, and near Roscoe a fine fifty-acre field of winter wheat, with three large wheat straw-stacks in the field, showing that it was wheat after wheat. The wheat was dark-green, and hugged the ground, which is what a wheat-grower likes to see at this season. The railroad goes through a large bed of remarkably white gravel, fine, and free from earth. It must make splendid roads. The railroad uses it for ballast. Charley noticed with interest a long row of willows, near Rock River, that are used as fence posts for barbed wire. Near Beloit, Wis., ninety-eight miles from Chicago, a road-scraper was smoothing and leveling the roads. We have the same scraper in "York State," and we use it when we work out our road tax, but owing to our absurd law, it lies idle the rest of the year. "Why so?" asked Charley. "Because," said I, "our path-masters do not come into office until the spring, and they are obliged to have all the road-tax worked out before the first of October. If we want to draw gravel in the winter, or use the scraper at this season, we can get no legal credit for the work." Charley knew this was one of my hobbies, and he remarked, "Tobacco seems to be largely grown in this section."—"Yes," said I, "but I suppose as a second crop."

After we left Madison, Wis., I noticed a very intelligent looking gentleman, that I thought from his quiet manner and sensible, calm face, might be a farmer. He proved to be Mr. Williams, of Baraboo, one of the oldest Shorthorn breeders in the State. We talked about farming, dairying, etc., until he reached home. As I wish to go through the country by daylight, we stopped over night at Elroy.

Saturday, Oct. 18, we left Elroy at 5 A. M. Passed through Wilton, Norwalk, and Summit, in the gray of the morning. The cows and calves lying on the frosty

* See page 532, second and third columns.

ground, seemed to be in no hurry to get up. This is a rather hilly country, well adapted for sheep and dairying. We pass a lot of small, white pigs, eating their breakfast of ears of corn in a pen. Also four wheat stacks, English built, but not thatbeaded, and a brick farm house, English, too. From Summit to Sparta is a beautiful and well cultivated country. Buckwheat seems to be grown to a considerable extent in small patches.

Sparta.—"Twenty minutes for breakfast."

The sharp, frosty air, gave us all a good appetite. After breakfast, we pass a flock of sheep, the first I have seen since leaving Madison.

Bangor is a fine section. Considerable fall-plowing. Horses in the corn-field doing their own busking. Hop yards. More fall plowing, three horses abreast. Everything indicates thrift. More sheep—and good ones. West Salem is a fine village, with plenty of trees along the streets and roads in the vicinity; good land, and good farms. Soon we strike the hills and evergreens and ride for miles through a beautiful, picturesque country. We pass the mail car going east, and see a boy distributing matter, evidently puzzled where to put it. Finally, with an uncertain air, he throws it into a box. Our present postage laws would puzzle a Philadelphia lawyer, let alone a poor boy on a postal car going all night.

Onalaska is a pleasant village near a large river, with thousands of logs; saw a man plowing sod with four horses, two and two ahead of each other. Crooked furrows. Good clover. Prairie grass on the one hand, and high, rolling land on the other, with winter wheat.

Winona.—"Now, Cbarley, for your first view of the Mississippi!" We pass over it on a substantial bridge, standing on the platform. A clear, rapid, beautiful stream. Now we are in Minnesota. We have been in New York, Canada, Michigan, Illinois, Wisconsin, and are now about to see something of Minnesota. Winona is a fine, well-built, substantial, enterprising city. A lady comes on board with a hunch of dabbias in her hand, she does not live in Winona. Lives in the country—on the prairie, and likes it. Has visited East. Spent a winter in Essex Co., N. Y., and Rutland, Vt. Likes the West better. Good society; reading club; good schools; good churches, and good singing—said nothing about the preaching. Winters are cold, but if provided for, not disagreeable—in fact very pleasant.

Stockton.—A fine farm on the right hand. Short-born cattle and grades, good horses and colts, all in the same field. High bluffs. Three-horse sulky plow; hard work, but they go right along.

Lewiston and Utica, a magnificent country.

St. Charles.—Beautiful rolling land. Good clover. "Stacks of wheat," literally, but many of them poor stacks, small, and not too well built.*

Timothy seed still in stock. "Poor year for timothy seed," says a farmer by my side; "too cold in May. Good May for wheat; but timothy needs warm-growing weather early in spring. Timothy seed low this year. I took some to Chicago, got one dollar and thirty-two cents per bushel of forty-five pounds. It costs eighteen cents per bushel to get it from New Ulm, Minn., to Chicago. The price in New Ulm is \$1.00 per bushel."

It turned out that my companion was a grain and seed dealer from New Ulm. "Last year," he said, "I sold timothy seed in Chicago for one dollar and twenty-two cents per bushel. In 1883 I sold it for two dollars and fifty-two and a half cents per bushel. That paid—that was all right." Pays fifteen cents per bushel for threshing. The machines do not thresh it clean. Does not know why. Much seed is left in the heads unthreshed. Does not raise red-top, or millet, or Hungarian grass seed. "I tell you," he said, as we pass a fine field of red clover, "I like to see that. Where you can raise clover, you can raise anything."

We passed a wheat stubble field as we approach Eyota, with a lot of manure drawn out in heaps. Field partly plowed. In the next field was a flock of Merino sheep, and that explains the manure. Lombardy poplar trees around the farm house and buildings; also, wind-mill. Willows for fences and screens. "Wheat," said my friend, "does best after corn—that, and new breaking. If the corn is clean, we frequently sow wheat without plowing." He referred to spring wheat. Wheat straw is burned. Uses a scraper to draw the ashes about. Do good when scattered about, but when left in a heap, kill everything but weeds.

Chester.—Three large wheat-straw stacks, mere heaps. Good hogs in pasture. Six wheat stacks unthreshed. Looked small, but my friend said they would average at least one hundred bushels to a stack. Splendid pasture, well stocked with grade Shorthorn cattle.

*This was written at the time on the cars. We saw thousands of such stacks afterwards. And I have an idea, that if I had seen these stacks last instead of first, I should have thought them about perfect. A close examination of the stacks in the West, shows them to be better than they look. In fact, they are, as a rule, admirably well calculated to shed rain, but their first appearance to us was not particularly pleasing.

Rochester, Minn.—Still a rich, rolling country—considering extent, perhaps the finest I have ever passed over. Does not look like one's preconceived ideas of the West, except in stacking wheat and burning straw. My companion from New Ulm owns several farms. Rents them, and receives one-third the crop. "All I have to do is to hold the bag, and haul the grain from the machine." He gets about two dollars per acre rent, or eight per cent on what the land would sell for, say twenty-five dollars per acre. He did not tell me, but I inferred that not half the farm was under cultivation, and for the pasture and untilled land he got nothing. "A creamery at New Ulm makes one thousand pounds of butter per day. Boston and New York men come here to buy it. Dairying pays better than anything else—than wheat."

At **Dodge Center** there was a large gathering of farm teams in a grove. At **Claremont** is a wind-mill for grinding wheat. Sheds covered with straw. Apple trees few and far between. "Plenty of apples," said my companion. Perhaps so, I thought, but it is evident that farmers and their families do not have them unless they buy them. I never before realized what an important matter the question as to the best varieties of fruit is in a new country.

Waseca.—A clear, beautiful lake. A large prairie. Woman plowing with three horses. She ought to have a sulky. Janesville, Kasota, St. Peter, Oshawa, and Nicollet, are all thrifty villages in a rich prairie country.

Cortland.—Beautiful rolling land. Steam thrasher at work. Steamers not so common as with us. Coal dearer, oats and hay cheaper. Flock of twenty or thirty prairie chickens get up as the train passes swiftly by.

At **New Ulm** my intelligent chance acquaintance leaves me. "All this section," he said, "is settled with Germans. They were all poor, are now all rich. No corn sold, all consumed on the farm. Feed corn stalks, but hay is only three dollars and seventy-five cents per ton, delivered in the village. Soft coal is four dollars and fifty cents per ton at wholesale.

Sleepy-Eye and Springfield are thriving villages. Beautiful rolling prairie as far as the eye reaches.

Mr. Harris will continue his valuable Notes on Western Travel in succeeding numbers of the American Agriculturist.

Animal Ailments.

BLOOD SPAVIN.—A. L. Jackson, Polk Co., Minn.—"I have a yearling colt which had its feet neglected until they were very long. A few days ago I noticed he was 'spavined' in both legs. It is said to be Blood Spavin."—"In this case the spavined condition, if actually present, is due to hereditary causes. A blood spavin is strictly a distended condition of the vein, which has become enlarged from being pressed upon by the growth of the bony or bursal tumor of the hock, which latter constitutes either bone or bog spavin. No special treatment can be of avail in so young an animal. Give him good pasturage and good food at all times, with plenty of chance for liberty of action. As he grows older and stronger, nature will aid in effecting a cure, especially if proper care has been exercised. At any rate, the animal should not be subjected to labor until the limbs have become consolidated by age. No colt's foot should be tampered with unless diseased, not even when shod."

MILCH COWS CHEWING BONES.—F. H. Laulton, Coffey Co., Kas., enquires why milch cows chew old dry bones, and other foreign substances, and what will cure them. This propensity to chew and suck bones, depends principally upon the want of the animal system for certain earthy salts, which have not been supplied by the nutriment given. It is a disease of barren, exhausted soils, the produce of such lands being wanting in just these elements. For treatment, give richer fodder from other localities, or pasture the animals on newer or better land. Improve the general health by attention to cleanliness, ventilation and sunshine. Keep the skin in the best condition by daily earing and brushing. In the meantime, improve the land by supplying it with the preparations essential for restoring its value for the purposes desired. Use bone-dust, phosphate, plaster, etc.

DISLOCATION OF TENDON OVER HOCK JOINT.—W. M. Harvard (address not given), owns a mare that has been injured by strain. "The cap of the hock joint seems to have slipped out of place. There are two swellings, one on each side of the joint of the hock. It was done about ten months ago. There seems to be considerable inflammation in it."—"From the history of the case, this is an instance where the tendon has been torn from its attachments at the joint of the hock, and has been forced to one side, generally the outer. It is an accident of very rare occurrence. Nothing can be done beyond enjoining perfect rest and the application of wet bandages until all inflammation has passed. Then the animal may be put to light, slow work, and it will eventually regain its usefulness but not the natural beauty of the hock."

Chat with Readers.

Plant for a Name.—G. M. B. Viser, Cook Co., Ill., sends us, for a name, a little plant quite common in sandy soils in late summer, the Partridge Pea, *Cassia chamaecrista*. It is an annual, about a foot high, with compound leaves of many small leaflets, and numerous bright yellow flowers. It is related to the Sensitive Plant, and, like that, its leaves shut up when disturbed, though much more slowly.

Transplanting Trees.—F. M. Gordon, Stanley Co., Dakota, has a number of Seedling Maples, and Box Elders, and wishes to know the best time to transplant them.—If the climate of the locality is favorable for fall planting, the season is now too late to risk it. Plant as early in spring as the soil can be worked, and to protect them in the dry season, cover the soil over the roots with an ample mulch of some kind—straw, wild hay, leafy brush, or whatever will cover the surface, and prevent evaporation.

A Berry from Manitoba.—M. M. Muckle, Manitoba, sends us for a name, a native berry which is "a nice fruit for jam, and pies." It grows but sparsely in Manitoba, but is in profusion in the Northwest Territory.—The fruit in question is of the Buffalo Berry, *Shepherdia argentea*, a shrub five to ten feet high, with sharp pointed twigs. The staminate and pistillate flowers are in separate plants. The fruit is scarlet, the size of a small pea, in dense clusters, and is sometimes cultivated for its fruit, to have which, both sexes must be planted. The fruit is much liked by all who know it.

The Uses of the Catalpas.—R. L. Williams, Baltimore Co., Md. There are two species of Catalpa, that called *C. speciosa*, being more hardy than *C. bignonioides* and preferable for planting in the Northern States. The wood of both is remarkably durable. We have a piece that has been exposed to the weather for seventy-five years, which is perfectly sound, and the trees will, under proper treatment, prove profitable to timber planters. For railroad ties, fence posts, and other uses where most wood speedily decays, the Catalpa timber resists the destructive influences in a remarkable manner.

Rosebuds.—If any insect has been regarded as "iron-clad" against the usual insecticides, it is the Rosebug, *B. Hathaway*, writes us from Manitoba, that he kept the insects from destroying his roses, by "a handful of Quassia chips, boiled in one or two gallons of water." He omits to state how it was applied, but we presume it was sprinkled upon the plants. Quassia has a reputation as a fly poison; if it is also fatal to the hard-shelled Rosebug, its usefulness will be increased. Quassia is kept in every drug store, and is not dear. We mentally "stick a pin" here, to try Quassia next rose-time.

Apples Blooming in September.—G. D. Welch, Suffolk Co., Mass., writes us that he has a crab apple tree, which, about the first of September, commenced to bloom; as fast as the fruit set, and the blossoms fell, new flowers continued to appear. He asks if this is at all common.—After a tree has perfected its leaf-buds, and fruit-buds, cool weather usually comes on, and these remain dormant until spring. If the fall is unusually warm, the buds are excited, and instead of waiting until spring, they open in autumn. This often happens with strawberries, which not only bloom, but ripen fruit in autumn. This unseasonable flowering and fruiting is at the expense of next year's crop.

"The Eucalyptus Tree."—J. N. Cole, Norfolk Co., Va., writes us: "The Eucalyptus tree is said to be a very fine grower, and an anti-malarial tree, or a tree which should be cultivated in a malarial country," and wishes information about the tree.—As there are about a hundred species of Eucalyptus in Australia, the term, "the Eucalyptus," is not very definite. The species for which anti-malarial properties are claimed, is *E. globulus*, the "Blue Gum tree" of Australia. Whether it has the power to avert malaria, we much doubt. Our correspondent can not readily test it, as the tree is not likely to prove hardy with him. Indeed, it is not certainly hardy at any point on the Atlantic Coast, north of Florida.

Trouble with Grapes.—Henry Fritz, Cambria Co., Pa., has several varieties of grapes, which did well until three years ago. Now, while the fruit is quite small, white specks appear upon the berries, and afterwards they rot and drop from the clusters.—Apparently mildew or some similar fungus causes the "white spots," which are the beginning of the trouble. Try Flowers of Sulphur, applied liberally by means of a bellows made for the purpose, and sold at the implement stores. The application should be made at the very first appearance of the white spots. If the date of their appearance is known, it will be well to apply sulphur a few days before. Use the sulphur on a hot, quiet day, and repeat weekly as long as spots appear.

Preserving Fence Posts.—Every now and then the secular papers publish something relating to agriculture, more or less absurd, and it goes the rounds, being quoted from one to another. The item, after it has gone around, is allowed to rest for a few years, when some one revives it, and the same thing is repeated. One of these items is to the effect that fence posts, of any kind of timber, will last as long as locust, if painted with boiled linseed oil, and then given a coating of pulverized charcoal. J. W. Bailey, Frederick Co., Va., sends us the above item, and asks if it is true.—The matter looks to us very improbable, and we do not think that posts so treated would be appreciably more durable than those without it. Charring thoroughly the portion of the posts that goes into the ground, would be far more useful, because charcoal does not easily decay.

Farmers' Folly.
Some farmers adhere, even against the full light of fact and discovery, to the old fashioned folly of coloring butter with carrots, annatto, and inferior substances, notwithstanding the splendid record made by the Improved Butter Color, prepared by Wells, Richardson & Co., Burlington, Vt. At scores of the best Agricultural Fairs, it has received the highest award over all competitors.

NEW + VEGETABLES + A SPECIALTY.

A customer writes: "For 26 years I have dealt with you. I have lived in Iowa, Missouri, Kansas, and Colorado, and no matter what soil or climate, the result was always the same, to wit: religiously honest and good." This is the quality of seed I would be happy to supply to all farmers and gardeners in the United States, sending them free my new vegetable and flower seed Catalogue for 1885. The collection of vegetable seed I offer, is one of the most extensive found in any American Catalogue. A large portion of it being of my own growing. As the original introducer of the Eclipse Beet, Early Ohio, and Burbank Potatoes, Marblehead Early Corn, the Hubbard Squash, Marblehead Cabbage, and a score of other new vegetables, I invite the patronage of the public. In the gardens and on the farms of those who plant my seed, will be found my best advertisement.

JAMES J. H. GREGORY, Marblehead, Mass.

"A C M E"

PULVERIZING HARROW

AGENTS WANTED.

It is the best selling tool on earth.

Clod Crusher and Leveler.

The "ACME" subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning process of double gangs of CAST STEEL CULTURERS, the peculiar shape and arrangement of which give immense cutting power. Thus the three operations of crushing lumps, leveling off the ground and thoroughly pulverizing the soil are performed at the same time. The entire absence of Spikes or Spring Teeth avoids pulling up rubbish. It is especially adapted to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that cuts over the entire surface of the ground.

We make a Variety of Sizes working from 4 to 15 Feet Wide.

DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurance that it is something better, but SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL. We will send the Double Gang Acme to any responsible farmer in the United States on trial, and if it does not suit, you may send it back, we paying return freight charges. We don't ask for pay until you have tried it on your own farm.

Send for Pamphlet Containing Thousands of Testimonials from 46 different States and Territories.

FOOD

THE only perfect substitute for Mother's Milk. The most nourishing diet for invalids and nursing mothers. Keeps in all climates. Commended by Physicians. Sold everywhere. Send for our Book on the Care and Feeding of Infants. Sent free.
DOLIBER, GOODALE & CO., Boston, Mass.

GRATEFUL-COMFORTING.

EPPS'S COCOA.

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—Civil Service Gazette.

Made simply with boiling water or milk. Sold only in half-pound tins by Grocers, labelled thus:
JAMES EPPS & CO., Homoeopathic Chemists,
London, England.

"They Did Not Bite."

In past numbers of the *American Agriculturist*, we have exposed the lottery schemes of Mr. Martin Meyer, Jr., of "Hamburg, Germany," a persistent swindler, who continues to flood the Middle and Western States with lottery circulars, printed in the English and German languages. A subscriber, Mr. J. A., writes us from Burlington, Iowa, that a whole batch of these circulars have been sent to a College Boarding Club in that city. "The students, however, were not inclined to bite at such bait, but, on the contrary, became anxious that the public might be warned against this lottery." To every subscriber we have to say, immediately throw into the fire every document of every description received from Martin Meyer, Jr., or any other similar swindler.

The "German Method" with Eggs.

Not long ago, the "Havaua Method" of preserving eggs was offered for sale. We showed that it was the old lime process, with the addition, in small quantities, of articles that could add nothing to its preservative properties. Now the "German method" is offered as a premium for subscribers by a Western paper. This sheet claims to "have finally succeeded in getting it (the German method), from Prof. Liebig, the German chemist," and professes to quote from what he says about the method. The only person who could with any propriety be called Prof. Liebig, the "German Chemist," has been dead for more than ten years. Where has the "German Method" been all this while? or who is it that this paper attempts to pass off as "the German Chemist?" The doubtful manner of its introduction throws great doubt upon the German "method."

"RECEIPTS" FOR SALE.

The same paper claims to have "obtained, after much labor and research," "receipts" for sixteen of the prominent proprietary or secret medicines of the day, such as Brandreth's Pills, Perry Davis's Pain Killer, Holloway's Ointment, etc., etc. Any one who supposes that any amount of "research" would induce the makers of the medicines to impart their formulas to others, can have very little knowledge of such matters. The so-called "receipts" can only be bogus imitations. How about that for the "German Method of preserving eggs?"

Idle Threats.

Two or three years ago, an individual residing in Washington, called upon us in person, and threatened to expend five hundred thousand dollars in prosecuting the *American Agriculturist*, unless certain statements made regarding him in our Hamburg Columns, were retracted. We have not yet seen a retraction. Six months, or more ago, another individual, now at the West, anticipating that we would ferret out and expose the various schemes whereby he had absorbed the funds of widows, orphans, and others, wrote us a very threatening letter. Subsequently we were informed through a second party, that the most formidable libel suits were to be brought against us. Still later we were notified by letter, that two hundred thousand dollars was in bank, for the purpose of "squelching the *American Agriculturist*." Now comes Pecksniff with a communication to the effect, that the swindler in person has "a big rod in

pickle" for us. The gentlemen who edit this Hamburg Column neither throw responsibility upon others, nor make their exit through cellar doors and elevators when called upon "on business." They have neither fled from this city, nor do they intend to flee. They can always be found here at 751 Broadway; and parties who either undertake to "squelch" this concern, or to intimidate the Editors, will find in the classic language of the street, that "they have bitten off more than they can chew."

Forcing the Growth of Hair.

Various preparations are advertised, "warranted," to produce a "flowing beard," or a "luxuriant mustache," in a given number of days, upon the smoothest face. If "C. H. D." will take our advice, he will not spend his money upon any of these nostrums, as they are quite unable to perform what they promise. The abundance or lack of beard, etc., is hereditary, and the growth cannot be forced. Neither the article named in the inquiry, nor any other, can force the hair to grow, unless there is a natural tendency in that direction. Don't waste money.

"Lettuce in Winter."

When a paper, claiming to teach farmers, publishes such nonsense as the following, it should be exposed. "It is said that heads of lettuce can be produced in winter in from twenty-four to forty-eight hours, by taking a small box filled with rich earth, in which one-third-part of slaked lime has been mixed, and watering the earth with luke-warm water; then taking seed, which has been previously soaked in strong brandy twenty-

THE U. S. GOVERNMENT ENDORSES THE AMERICAN

From the Tenth Census, Vol. 8th, Just Published

The American Agriculturist dates from 1842, and is one of the numerous periodicals of the same class which originated in all parts of the country at or about the same time, some of which are still in healthy existence, while others quickly subsided. The American Agriculturist is especially worthy of mention, because of the remarkable success that has attended the unique and untiring efforts of its proprietors to increase and extend its circulation, which at one time reached a point undoubtedly higher than was ever before attained by a journal of its class. Its contents are duplicated every month for a German edition, which also circulates widely.

four hours, and sowing in the usual way."—Whoever tries this, expecting to get heads of lettuce in the time mentioned, or in any other time, will find himself humbugged. "Strong brandy" will wonderfully increase the size of some heads, but they are not heads of lettuce.

Patent Medicines.

The *American Agriculturist* might have added fifty thousand dollars last year to its revenue, if it had admitted Patent Medicines indiscriminately to its columns. We shall continue, however, to rigidly exclude most of them, because while endeavoring to protect our subscribers from the swindling schemes of sharpers, through exposures in these Humbug columns, we do not propose to quietly permit unscrupulous Medicine Venders to prey upon these same subscribers, through our advertising columns. Beware of the thousands of concoctions of all kinds, which claim to heal all manner of ills. To be sure, there is now and then a patent or proprietary article possessing purity and virtue, but the number is limited.

Don't Touch It.

Whenever you read an advertisement now going the rounds, that a certain Lotion will cure eruptions, blotches, etc., on the face, don't touch it. The way to cure eruptions is to improve the general tone of the system, and thereby purify the blood. Don't touch it.

Wonderful Publishing Schemes.

We are deluged by our subscribers with advertisements of a new publishing scheme. Some Cincinnati publishers have shown a talent amounting to genius in devising methods in the line of their business. Of late, various papers have come to us in half mourning with the heavily black-bordered advertisement of "Ocean to Ocean," making, in heavy type, the offer of "A Long Loan at Four per Cent." The publishers of "Ocean to Ocean" (whatever that may be), modestly state that they "desire to secure the names of one million subscribers" at two dollars each. It offers a premium engraving, which will be sent upon the subscriber's forwarding forty-two cents (42 cents), and agreeing "to display it in a conspicuous place in his house or office."

THE MONEY FOR THE LOANS.

The source of the money to be loaned is explained, and we have seen nothing equal to it since the fabled milk-maid counted up the proceeds from her unhatched chickens. One million subscribers at two dollars will be two million dollars. Having this number of subscribers, advertisers will willingly pay ten dollars per line for advertisements, and the yearly income from this source is put at three million six hundred and forty thousand dollars, which, added to the amount from subscriptions, easily adds up five million six hundred and forty thousand dollars. Expenses for a year are estimated at one million seven hundred and fifty thousand dollars, and this, deducted from receipts, leaves as net profits three million.

Just after the above was written, the mail brought numerous papers with the advertisement of the "Chicago Globe." This advertisement is similarly black-bordered, offers another engraving for forty-two cents, and also announces a loan at four per cent. Sentence after sentence in the two advertisements, would indicate the same parentage for both, or that one is the copy of the other. In the way of figures the "Chicago Globe" is only one fourth as grand as "Ocean to Ocean;" only a quarter of a million subscribers are asked for, and on this basis the advertisements will bring in but two

dollars and fifty cents a line, and the profits to be loaned, amount to only a paltry one million two hundred and sixty thousand dollars. Figures have long had a reputation for truthfulness, and we allow them to tell their own story.

Social Medical Humbug.

Medical Hamburgs are not confined to the secret preparations so extravagantly advertised. It would be well if the law prevented prescribing by every one who is not a medical man. It is a popular notion that one who claims to teach some subjects, is capable of giving advice in others. We sometimes find clergymen prescribing for their parishioners, and editors going out of their sphere, if they have one, and advising their readers to use the same doses which they think they have found useful in their shattered health. Recently the promiscuous and continuous taking of small doses of quinine has been advised. Many are aware how seriously large doses of quinine affect the brain; disturbed hearing and sight, incoherent speech, and other symptoms of intoxication, being present. In small and repeated doses the "Quinine Habit" is confirmed, the brain is affected, and obliquity of moral as well as real vision may result. We have seen habitual takers of quinine who had lost the ability to distinguish right from wrong, or the difference between their own and other people's property, whose speech uttered falsehood more readily than truth, and whose whole conduct appeared to be under the influence of too much quinine. Always avoid indiscriminate dosing.

"Gossamer Garments Free!"

An advertisement, with the above attractive heading, appears in several papers, claiming to be more or less agricultural. The advertisement reads: "To any reader of this paper, who will agree to show our goods, and try to influence sales among friends, we will send, post-paid, two full-size, Ladies' Gossamer Water-proof Wearing Apparel as samples, provided you cut this out, and return with twenty-five cents to pay postage, etc."—Mrs. S. W. M., of Bergen Co., N. J., and others, having made inquiry as to the character of the "garments" thus offered, we visited the place advertised, in order to learn about them. After climbing several flights of stairs in a building on a street not far from the City Hall, we found the room occupied by the "Company." Four or five feet from the door was a board partition, at the end of which was a short counter. As we entered, two letter carriers were about leaving, an indication of considerable business by mail. The person in attendance was a very business-like lady, of whom we asked: "Are the gossamer garments advertised from this place delivered here?"—"They are only sent by mail."—"I would like to know about the sizes."—"They are just as stated in the advertisement."—"Can I see the articles?"—"They are all done up to go by mail," adding, rather impatiently, "we have no time to show goods."—It is evident that those ladies, who wish to know about this "Ladies' Gossamer Rubber Waterproof Wearing Apparel" can only obtain the information concerning them through the mail.

Cautionary Signals.**A High-Priced Pamphlet.**

Mr. H. Howard, St. Louis County, Mo., wishes to caution our readers against purchasing "The Printer's Foreman." He writes us: "The work is a first-class fraud... Fifteen cents would be a big price for the book (an eleven-page pamphlet)... F. C. Shepard, Evansburg, Pa., sends out the document, and takes in the two dollars and the gullible public, of which I happen to be one."—Look well into the matter before sending the two dollars.

Hog Cholera Remedies.

When the swine in a locality die from the disease known as "Hog Cholera," we do not wonder that their owners are attracted by the advertisements of those who claim to have sure cures. We can only answer inquiries as to these remedies, that so far as veterinary surgeons know, no remedy has yet been found. We can not, in the face of this declaration, advise the use of secret preparations, which claim so much against the probabilities.

Schools of Telegraphy.

Those who wish to learn the art of telegraphing, should be cautious how they choose among the various parties or schools, proposing to teach, and to guarantee situations to those who graduate from their establishments. Honest schools will give references to those who have been taught at them, and it will not be difficult to ascertain how they have dealt with others. All who demand pay in advance, should be looked upon with suspicion. Some parties have, by their conduct towards their pupils, made it necessary to advise caution.

The Monarch Lightning Saw.

We still continue to have letters both of inquiry and of complaint concerning the Monarch Lightning Saw, and we notice that extravagant advertisements still occupy a large space in agricultural journals that claim to be reputable. As a mechanical contrivance it is not plain that there can be any real gain in applying a crank motion to operating a cross-cut saw. At all events, so many have been disappointed, that we are warranted in cautioning our readers to look well into the machine before purchasing. In all such cases proper caution may avoid after disappointment, chagrin, and dissatisfaction.

Time Extended.

In offering our Family Cyclopædia as a present to every subscriber, new and old, who should renew for 1885, we have hitherto limited the time to December 1st. Owing, however, to the prolonged political excitement extending far into November, and absorbing people's minds and thoughts generally, we have concluded to extend the period during which the Cyclopædia will be presented to subscribers, new and old, until January 1st.

Don't Make a Mistake.—Only one Premium.

If readers will stop to think for a moment they will understand that we cannot present subscribers with a Cyclopædia, and at the same time allow them a large bonus in the way of premiums; that would virtually leave us nothing for the *American Agriculturist*, which in itself would be a cheap periodical at even \$3.00 a year. Naturally no one would suppose it was necessary to state that the name of a subscriber who receives the Cyclopædia cannot be counted for another premium. But we so explicitly state it in several places in the Premium List. Notwithstanding this, occasionally we receive a letter worded as if the writer expected to receive the Cyclopædia, and to have his name or the names of his friends counted for premiums in addition. Our friends have but to think a moment to realize that no such thing could have been intended by us, or could possibly be granted.

Our Beautiful Illustrations—Elevating in their Character.

The *American Agriculturist* aims to make country life and country surroundings so attractive that not only will the farmer's boys not desire to exchange the old home for business centres, but that the over-crowded unhappy dwellers of our cities may be tempted to exchange their lot for the freedom and enjoyment of rural pursuits. Our beautiful illustrations which we are now bringing out with every issue of the *American Agriculturist*, go very far in this direction. We are now employing the first artistic talent, and the engravings typical of rural life, and those describing all the labor-saving contrivances, are executed in the most superior manner. The *American Agriculturist* is everywhere recognized to-day, both as the leading authority in agricultural pursuits and the first illustrated Agricultural Journal of the world.

Forward Your Subscription Now.

Every subscriber renewing for 1885, will oblige us by immediately forwarding his subscription on receiving this December number. There is a great rush of subscriptions during December, and those who send their names now will avoid any delay or mistake which sometimes results in this rush of subscriptions.

Profitable Employment.

We have written to about ten thousand of our friends, who have hitherto secured subscriptions for the *American Agriculturist*, offering them special inducements to secure subscriptions for 1885; tomorrow we write to three thousand more of these old friends. We should like to have ten thousand, yes, fifty thousand new friends labor for the *American Agriculturist*. Indeed, every man, woman and child, who reads this number, can secure a few subscribers with profit to themselves and to those who subscribe. Write us for particulars. We remunerate those who work for us, either in cash or premiums, as they may desire. Last year we presented a Dictionary to our subscribers, this year we present them a Cyclopædia as our Holiday present. In return we shall be pleased to acknowledge Christmas presents from our subscribers in the shape of new accessions to our great army of readers. If every present reader will send

us only one new subscriber for 1885, we should have an army of new readers larger than the population of some of our individual States.

No Duplicate Numbers on Renewals.

Of course no present subscribers renewing for 1885 receive the October, November, and December numbers of this year extra, inasmuch as they already have them; these extra numbers are offered as an inducement for new subscribers. If in the haste of attending to the receipts of large numbers of subscriptions, some present subscribers in renewing receive extra numbers, will they please hand them to their friends and neighbors who they think may be induced to subscribe for the *American Agriculturist*.

The Great West.

Mr. Judd's Notes of Travel in the Far West, which have been running through the recent numbers of the *American Agriculturist*, are now supplemented by those of Mr. Joseph Harris, who has likewise been making an extended tour through regions concerning which our subscribers are always anxious to acquire information. Both of these gentlemen will, in succeeding numbers, give the results of their observations in the Far West, during the summer and autumn months.

Show Them to Your Friends.

The recipients of the Family Cyclopædia, with scarcely an exception, express themselves as surprised and delighted with the volume. Never before has such an opportunity been presented for securing such a work free, and probably never another such an opportunity will be afforded. In return for the receipt of this beautiful volume, may we ask the receivers to show this Cyclopædia to their friends and neighbors, with a view of having them avail themselves of the opportunity to procure one. We have just made arrangements for printing 50,000 more.

Exposure of Frauds and Humbugs.

Just now, as will be seen by glancing at the Humbug columns, there is an unusual number of new frauds and swindles being set afloat by rascals, who, like spiders, spin their nets from cities to catch the unwary and unsuspecting in the rural districts. The systematic exposure of these scamps will, as heretofore, constitute a prominent feature of the *American Agriculturist* during the coming year. Will all subscribers immediately forward us any circulars received by them of schemes which do not have the appearance of being honest and genuine. We will at once probe them.

Just So.

In moralizing upon the rigid scrutiny to which aspirants for public positions are subjected nowadays, a Western editor well observes: "Probably never before have our young men been so thoroughly taught that those who expect to come before the people for preferment, must, from boyhood up, lead honest as well as cleanly lives, in their private as well as public acts; for such contests surely bring forth the most hidden secrets." Fathers cannot be too careful in setting such an example in their daily lives, and in throwing such restraints around their young sons, that they will never be tempted to go astray, whether in public or private life.

Orange County, N. Y., Milk War.

—Mr. Lawson Valentine has just returned home from Europe, and Mr. John S. King, who enjoys a national reputation for large enterprises and great energy, has purchased the famous Huntington Farm, near Pine Island. With two such pushing men, having large means, and being in full sympathy with the Dairy Farmers of Orange County, the latter, under their leadership, should now re-open the war for their rights, and secure from the middle-men all the privileges for which they have been contending these many years.

W * H * Y

The American Agriculturist is better now than ever before.

First:—The *American Agriculturist* has been enlarged and vastly improved in all its various departments. It is now printed on super-calendered tinted paper with a glaze and finish which give clearness and distinctness to the type and illustrations.

Second:—In addition to the old staff of Editors and life-long contributors who have aided in making the Journal what it is to-day, new names have been added to our Editorial force, which will be still further strengthened with fresh acquisitions.

Third:—Joseph Harris, the founder of the "Genesee Farmer," author of "Walks and Talks on the Farm," etc., and whose agricultural writings have made him famous on both continents, has become one of the active Editors of the *American Agriculturist*.

Fourth:—The very note-worthy improvements made in the *American Agriculturist* since June last, embrace a complete transformation in the character of the illustrations. New and talented Artists have been employed, until the engravings and illustrations in the *American Agriculturist* have become, during the past four months, more numerous and far superior to those appearing in any similar publication. The *American Agriculturist* has for years been the recognized authority in all matters pertaining to agriculture; it has now, this year, become the first **Illustrated** Agricultural Journal of the world.

Fifth:—New methods and new agents for mailing have been employed, so that the *American Agriculturist* leaves the office as regularly as clock-work, and if any number fails to reach the subscriber, our new plan for discovery immediately makes known the cause.

Sixth:—The premium articles offered this year have been selected conjointly by the Editors and Publishers, to specially meet the wants of our great army of subscribers. While the list comprises very many new articles, those which have proved specially popular and desirable in the past are retained; all of them have been secured at great bargains, of which our subscribers get the benefit.

Seventh:—Every subscriber to the *American Agriculturist*, new or old, whose subscription for 1885 is forwarded immediately to us, together with \$1.65, is entitled to the **New American Agriculturist Family Cyclopædia**, 700 pages, 1,000 illustrations.

Good Guns.—Our Premium List presents a variety of excellent Guns at very moderate prices. If you want a repeating rifle, there is one in our advertising columns, page 558, which is worth the money asked for it, that is \$12.00. Any repeating rifle which works well, ought to be worth that money.

EVERY DAY IN THE COUNTRY.

By HARRISON WEIR.

USEFUL, SEASONABLE, AND ARTISTIC PRESENT.

This exquisite, 16mo. volume, has on one page space for daily memoranda, and on the opposite page, is a reference to some flower, bird, insect, or other natural feature likely to be met with at the season, with numerous engravings of these objects. There are besides, a number of full-page colored pictures. The author is well-known as an artist, for his delineation of rural subjects, and as a pleasant writer about them. This work is a tasteful specimen of book-making, and would be an acceptable present for any one, young or old. Sent, post-paid, for \$1.00.

Fearless Two-horse Power, positively **unequaled** for ease of team and amount of power, and Standard Feed-cutter that gives the most **unbounded** satisfaction. Cutting feed saves money. Economy says: **try it.** Fearless Threshers and Cleaners, Clover-hullers, Wood Circular-saw Machines and Fanning-mills, not excelled by any. Buy the best. Catalogue sent free. Address, **MINARD HARDER, Cobleskill, Schoharie Co., N. Y.**

LEADING DIVINES,
AND OTHERS, AS TO THE

Liebig Co's Coca Beef Tonic!

PRINCE NICHOLAS STCHERBATOV, of the Imperial Russian Navy (St. Petersburg, Russia), says: "It is a most excellent tonic."

BARON FALKENBERG (of the Royal British Rifles) says: "It is unquestionably superior to any other tonic which I have ever tried. It benefited me as no other tonic has ever before. My friends all praise it without stint."

Equally emphatic testimonials from Madame, the Marquise of Ganville, Paris; the Viscountess Vierira, Lisbon, Portugal; Edwin Booth, the celebrated actor; General Franz Sigel, New York City; General Louis Schaffner, Chicago, Ill.; Miss Mary L. Booth, Editress of *Harper's Bazar*; Professor E. M. Hale, M.D., LL.D., Chicago, Ill., and hundreds equally eminent.

The **REV. DR. C. H. GARDNER**, Principal of the celebrated Fifth Avenue Seminary for Young Ladies, N. Y. City, says: "I speak from grateful experience of its remarkable powers."

"It is far superior to the fashionable and illusive preparations of beef, wine and iron," says **PROFESSOR F. W. HUNT, M.D., LL.D.**, Honorary Member Imperial Medical Society of St. Petersburg, Russia, &c., &c., of New York City.

For choice reading, beauty of illustration and typography, and pure and high character, "ARTHUR'S ILLUSTRATED HOME MAGAZINE" has no rival. Established over thirty years ago by T. S. ARTHUR, who still remains its editor, it has always been a welcome visitor in thousands of American homes. Younger and fresher talent unite with the editor's maturer judgment in keeping the Magazine always up to the advancing tastes and social culture of the times.

A SAFE MAGAZINE. The pages of the Home Magazine are kept absolutely free from everything that can deprave the taste and lower the moral sentiment. It is, therefore, a pure and safe magazine. It aims to promote happiness in the family through the cultivation of a spirit of kindness, service, and self-forgetfulness.

Terms, \$2.00 A YEAR; three copies, \$5.00; eight copies and one extra, \$12.00. Specimen numbers free.

LOOK! ONLY 14 Cts for 3 French Dolls

WITH AN ELEGANT WARDROBE OF 32 PIECES.

CHEAPEST and BEST.

Consisting of Reception, Evening and Morning Dresses, Bonnets, Street Costumes, Cloaks, Hats, Hand Satchels, Sun Umbrellas, Music Portfolios, Overcoats, Sailor Suits, Military Suits, Drums, Street Jackets, Watertight Place Suits, Travelling Costumes, Dress Suits, &c. These Dresses and Suits in this Elegant Wardrobe represent Nine Different Colors, and they are lovely beyond description, several being from Designs by Worth, of Paris. There is One Little Boy and Two Girl Dolls in Each Set, with Pretty Faces and Life-like Beautiful Features, and their Wardrobe is so extensive that it takes hours to dress and undress them in their Different Suits. Every child and every Mother that has seen them go in ecstasies over them. Children will get more real enjoyment out of a Set of these French Dolls than out of articles that cost \$10. Every person that buys them sends immediately for more. A Lady writes us that her Little Boy and Girl played for five long hours with a Set of these French Dolls, and they felt very sorry indeed to think that they must stop and eat their supper, and if mothers only knew how much amusement there is in these Dolls they would willingly pay double the price asked for them. Sample set consisting of three dolls with their wardrobe of 32 pieces, by mail for 14 cents, 2 sets, 6 dolls, 64 pieces, for 22c., 12 sets for \$1, you get \$1.80; 25 sets for \$2, you get \$3.75 for them; 50 sets for \$3.85, you get \$7.50; 100 sets \$6 by express, you get \$15. Any boy, girl or agent can sell 100 sets every day; if you do that you make over \$50 a week. If you send for one or two sets we will send our Secret Method and Full Directions how you can make more than \$100 a month out of these dolls. You have not one day to lose, as each day's delay is dollars lost to you. If you have not the money now cut this out, as it will not appear again before Christmas, and is an opportunity too valuable to lose. Postage stamps taken. Address **United States Co., Hartford, Conn.**

Is now in use for breeding Hereford and grade Hereford cattle. Satisfactory reasons given for selling.

E. W. PAYNE, Morrison, Whiteside Co., Ill.

SUPPLEMENTAL * PREMIUMS.

The numbers running on from 228 on the regular List. (See Premium List, or October Supplement.)

No. 229.—The Hunter's Pet.

A DESIRABLE PREMIUM

—FOR—

COUNTRY OR TOWN.

Sixteen years ago the *American Agriculturist* afforded a great deal of pleasure and satisfaction to its readers in every section of the country, in directing their attention to a remarkable little fire-arm called the Breech-loading Pocket Rifle, it weighed only eleven ounces, and shot with great accuracy and power from ten to one hundred yards, could be loaded and fired five times a minute, and could be carried in a side-pocket while working in the fields, ready to bring down game on short notice. It was exceedingly convenient in new countries as a defensive weapon, and useful generally on the farm. Mr. Judd used this gun with great success and pleasure. Now, after a lapse of sixteen years, when rifles of all makes and patterns have been introduced in all lands, we reproduce as a premium this Rifle, which has been enlarged and greatly improved, because we consider it (the Hunter's Pet), as we then did sixteen years ago, the best thing of the kind in the world.

The barrel of this Rifle is made of the finest quality, de-carbonized steel, and each barrel is thoroughly tested at the factory before it is sent out, thereby guaranteeing absolute safety. The action, although perfectly simple, both in its construction and working, is one of the most reliable, as well as durable actions now in use. The stock is heavily nickel-plated and handsomely finished, and has an extension skeleton breech, nickel-plated, which can be instantaneously either screwed on,

(From the *American Agriculturist*, January, 1869.)

Distance, 66 Yards.
Twenty-five successive
shots, fired Dec. 5, 1868,
by David W. Judd.

(or taken off), thereby enabling one to steady the piece while firing; when not in use, it can be easily carried in a side pocket. For accuracy, penetration, and wear, this little Rifle is equal to many of the best and most popular makes now in the market.

One of the strong points of this remarkable fire-arm, is its simplicity, both of construction, and action; it requires no special instructions to manage it, in fact any one can at once use it, and if at all accurate in aim, can make most excellent targets. For small game shooting, or gallery practice, it is equally well adapted.

This rifle can be had in 22, 32, 38, or 44 calibre, Rim Fire, or 32, 38, or 44 calibre Central Fire, with combined sights. 18-inch. Price \$18.00. 20 subscriptions at \$1.50 each, will secure this elegant premium; OR, we will send it, pre-paid, on receipt of price.

No. 230.—The Famous Flobert Parlor Target Rifle.—Price \$4.50.—The famous Flobert Rifle, while used for target practice at the same time, is a most desirable and useful weapon for destroying small birds, and for driving away annoying animals, without killing them—cats for example. One of the managers of the *American Agriculturist* was for months unable to sleep, owing to the ceaseless quarreling of cats in the back yard. He procured one of these Flobert's, and after a few evenings peace reigned in the vicinity. None of the cats were killed, but they were all sufficiently tickled with the Flobert sensation, as to abandon that neighborhood. Everybody in the vicinity has expressed gratitude to the gentleman, who has through means of the Flobert insured tranquility after night-fall. The Flobert is a breech-loader, causes little or no noise, uses either a ball, or a small load of shot. The barrel, which is a breech-loader, is solid, and can be used with perfect safety. Indeed, the one employed by the gentleman alluded to above, caused little

or no noise, and the only evidences of the discharge to lookers-on, was afforded in the rapid disappearance of the cats. We know of no weapon which affords more pleasure for target practice, at short range, or which so quietly and successfully clears one yard, or a neighborhood of cats or dogs, if necessary, without inflicting any serious injury upon them; that is, when you use the small shot. The ball, of course, penetrates the body of the cat, dog, or any other animal, with the natural results which follow penetration, of cold lead as a solid. Is there a farm house in the country, or a dwelling in the village, which is not at some time more or less infested after dark with strange cats or dogs; herein lies deliverance. 6 subscriptions, at \$1.50 each, will secure this premium; OR, we will send it on receipt of price. Receiver to pay small expressage.

No. 231.—The Semi-Hammerless Gun.—Price \$15.00.—A new model, combining all the advantages of the hammerless action without the danger of the self-cocking principle. The barrel is of genuine twist, is thoroughly tested at the factory, and is perfectly safe. It has the reliable and durable top-lever action, rebounding lock, snap fore-end, nickel frame, and is choke-bored. The stock is of selected Italian walnut, finely polished and oiled, (13¼ inches long, 3-inch drop), with pistol grip, checkered. 12-bore, and 28 or 30-inch barrels. Weight about 7 lbs. 20 subscriptions at \$1.50 each will secure this premium; OR, we will send it for the price. Receiver to pay small expressage.

No. 232.—Cartridge Bag.—Price \$1.25.—A most useful article for hunters, sportsmen, and persons in the country generally. It is made of strong waterproof brown canvass, with loops inside, from which the loaded shells are taken; discharged shells are kept separately in the bottom of the bag; in a second compartment can be carried a lunch-box, field cleaner, etc., etc. This desirable premium will be furnished free of charge to any one sending us 2 subscriptions at \$1.50 each; OR, will be sent, post-paid, on receipt of price.

No. 233.—Pocket Drinking Cup, Cork-screw, and Pencil.—For one subscription.—The first two will be found a great convenience to tourists, and picnic parties. A tin case goes with the cup, in which it can be kept when not in use, and the corkscrew also is enclosed in a nickel case. The pen is a stylographic, or re-

No. 233.

servoir pen, which, when once filled with ink, will write several days without refilling. Can be carried in the pocket, and is always ready for use. A valuable gift for any one, at one-sixth the price of any other. Supplied, post-paid, for 1 subscription at \$1.50, and ten cents for mailing. Here are three excellent Premiums for one subscriber.

No. 234.—Improved Roller Skates.—Price \$1.25.—Roller Skating is the favorite amusement

No. 235.—Automatic Shawl Strap.—Double Handle.—Price 35 cts.—Every lady requires a shawl strap for shopping and travelling; while for school-children they are invaluable in carrying books and lunch to and from school. We offer the best shawl or parcel carrier made, with blue straps and ebonized handles, for 1 subscriber at \$1.50; OR, supply it for the price, post-paid.

No. 235.

No. 236.

No. 236.

No. 236.—Another Valuable Combination Gift.—A Bonanza Charity Box, or Money Holder, a nickel-plated Tape Measure, and a Universal Glass Cutter. For one subscription.—The money holder is a dainty little ornament, worn attached to a lady's waist, and is designed for carrying five-cent nickels, and ten-cent silver pieces. Will be found very convenient for car-fare and church money. The tape-measure is a gem

No. 233.

No. 233.

in its way, and should be in every household. The glazing tool, for cutting and setting glass, will cut equal to and is better than a diamond for ordinary purposes. Presented for 1 subscription at \$1.50, and ten cents extra for mailing; OR, supplied post-paid for price.

NO SUBSCRIPTION CAN COUNT TOWARDS MORE THAN ONE PREMIUM IN ANY CASE.

No. 237.—The Novelty Pocket Scale.—Price 50 cents.—Every farmer and merchant should own one of these Pocket Scales. A triumph of modern ingenuity. A universal want filled at last. It can be carried in the pocket and weighs with accuracy from 2 ounces up to 15 pounds. It is heavily nickel-plated, and will last a life time. Given for 1 new subscription; OR, supplied, post-paid, for price.

No. 238.—Ring Toss for Parlor or Field.—Price \$1.25.—This charming game may be played either in the house or on the lawn. There are five rings of various sizes, made of rattan, and wound with gay-colored webbing, that present a beautiful appearance, at the same time being perfectly harmless to wall or furniture. The game is, to throw these hoops over a standard, or target post, at a given distance. They come put up neatly in a wooden box. A healthful and fascinating amusement for winter evenings. Supplied for 2 subscriptions at \$1.50 each; OR, furnished for price, post-paid.

No. 239.—An Entirely New Bulls' Eye Lantern.—Price \$1.50.—Made of the finest quality of Brass, elegantly polished and finished with a heavy convex glass lens, that causes it to throw a powerful light a long distance. It is so compactly made that it can be easily fastened to either hat or belt, or is easily carried by hand. In the country, as well as in villages and smaller towns where Electric lights and Gas are not in use, this Lantern will be found a most cheerful companion to the evening church meetings, spelling-schools, visiting nights, or other necessary or desirable journeys to and from your home. For Riding, Hunting, Fishing, or for use in and about the House, Barns, Stables, or out-buildings, it is invaluable. In beauty of design and construction, as well as safety and durability, there is no other Lantern of the kind that compares with this. We take especial pleasure in recommending this elegant and useful article to our readers, and at the exceedingly low price at which it is offered, we feel satisfied that it will meet with a large demand and prove exceedingly valuable and satisfactory. Only 2 subscriptions at \$1.50 each are required to secure this premium free of charge; OR, we will send it, post-paid, on receipt of price.

No. 240.—The Oriental Clock.—Price \$3.—This exquisite little time-piece will be the delight of all who see it. It is 3½ inches high, and of Bronze or Oxidize finish. It is Egyptian in design, two Sphinx-like figures being the supports. Presented, post-paid, for 4 subscriptions at \$1.50 each; OR, supplied for the price.

No. 241.—The Little Jewel.—Price \$1.75.—This dainty bijou, is a small clock of simpler finish than the Oriental, but almost as desirable. It is four inches in height. One Day Pendulum. Nickel-finish. Sent enclosed in case, post-paid, for 3 subscriptions at \$1.50 each; OR, on receipt of price.

No. 242.—The New Choral Top.—Price 50 cts.—This mechanical top is spun in the same manner as other singing-tops, but has the advantage of an Indian-rubber shoe so it can play on the finest table without danger of spoiling the varnished surface. The Top is painted in gay colors, and dances in such a quiet way, that every sound of the choral is clearly heard. The Top changes by itself the accord, if not, you touch slowly the upper point, and immediately the accord changes into another choral. Presented for 1 subscription at \$1.50; OR, sent post-paid on receipt of price.

No. 243.—Wilcox Breech-loading Gun.—Price \$1.30.—Just the thing for boys.

Latest and best Gun of this kind. Its entire length is 39 inches. Makes no report, and therefore does not "alarm the game." Will carry 600

feet. With every Gun are included five metallic-pointed arrows and two targets inclosed in the breech. Sent post-paid, for 2 subscriptions, at \$1.50 each; OR, supplied at the price.

OUR NEW AND GREAT PREMIUM for BOYS.

THE WEEDEN UPRIGHT STEAM ENGINE.

For years we have been endeavoring to procure a small machine, worked by steam power, which should not only be safe and reliable, but should perform all the necessary labor which juveniles desire to secure from steam power, in the way of amusement and diversion. We at last have this machine in The Weeden Upright Steam Engine, which affords abundant steam power for running toy machinery. The engraving, while it gives some idea of this most beautiful miniature engine, does not convey to the eye anything like the full description as to its size and power. It is double the size of the illustration, being 8½x4¼ inches. Indeed, no Engine with the capacity and power of this Weeden has before been sold at less than \$6.00. The boiler, fire-box, and smoke-stack are painted black; the cylinder, safety-valve, steam-whistle, pulley wheel, and the driving-wheel are all of them brass plated. The throttle-valve, top of smoke-stack, steam-whistle valve, safety-valve ball, and the ventilated openings are painted red.

No. 244.

Your Own Engineer.—Every boy, in fact every girl, who is interested in such matters, can now run their own machine, not only affording great pleasure to themselves, but to all their friends, old and young.

Great Pleasure and Amusement.—Indeed, we cannot conceive of a pleasanter way for spending a long winter evening, than for the family to gather around the table on which one of these engines is placed, and watch the various mechanical contrivances which can be attached thereto. A person of ordinary ingenuity can invent sufficient movable figures, to be kept dancing for an evening around the entire room, thereby entertaining not only the family, but any number of lookers-on.

For Juvenile Classes and Schools.—Every instructor in this land, public or private, who has to do with children, should secure one of these miniature engines as a means not only for showing how large engines are worked, but for developing the taste of children in a practical direction. A few years ago we wrote to the various teachers throughout the country, and sent out about 40,000 of our microscopes; we shall not be surprised if double that number of these engines are ordered, being as it is, far superior to anything of the kind ever made.

Conditions on which the Engine can be obtained.—Presented, post-paid, for 2 subscriptions at \$1.50 each; OR, delivered here at our office for \$1.25; OR, sent free to any Post-office address in the United States or Territories for \$1.60.

SAFETY-VALVE.—The Engine has a perfect working Safety-Valve, which makes it impossible for the boiler to explode.

STEAM WHISTLE.—By referring to the cut you will notice the location of the Steam Whistle. You will also see the valve by which the whistle is operated.

THE THROTTLE-VALVE.—One very important feature of this Engine is its Throttle-Valve, by means of which the engine is started and stopped. No other amateur Engine has this feature.

THE STEAM-EXHAUST.—All oscillating Engines exhaust at the ports. This Engine exhausts into the smoke-stack, and thus the steam passes off into the air.

THE FIRE-BOX.—The door opening into the Fire-Box has perfect hinges and catch. The patent lamp for getting up steam is attached to the inner side of the door. When you open the door you "draw the fire;" when you shut the door the lamp is in position, under the boiler.

THE POWER OF THE ENGINE.—The Engine has sufficient power for running toy machinery. So perfectly and accurately is this Engine made that the screws on the cylinder-head and the rivet-heads on the boiler and fire-box are represented (see cut).

A Great Mechanical Curiosity.

While this Engine performs no little labor, it is a very great object of attraction and beauty, not only because of its mechanical perfection, but as a model for engineers and practical machinists. Indeed, as it stands on the table before you, you wonder that so much machinery can be combined and sold at the figures at which, by special arrangement, we supply this.

GOOD NEWS TO LADIES!

Now's your time to get up Orders for our CELEBRATED TEAS and COFFEES, and secure a beautiful MOSS ROSE or GOLD-BAND CHINA TEA-SET (44 pieces), our own importation. One of these beautiful china sets given away to the party sending an order for \$25. This is the greatest inducement ever offered. Send in your orders and enjoy a cup of GOOD TEA or COFFEE, and at the same time procure a HANDSOME CHINA TEA-SET. No humbug. Good Teas, 30c., 35c., and 40c. per lb. Excellent Teas, 50c. and 60c., and very best from 65c. to 90c. We are the oldest and largest Tea Company in the business. The reputation of our house requires no comment. We have just imported some very fine WHITE GRANITE DINNER SETS, (115 pieces), which we give away with Tea and Coffee orders of \$40 and upwards. For full particulars, Address THE GREAT AMERICAN TEA CO.

THE NEW CORSET. THE "TRICORA RELIEF."

Having elastic sections at the upper and lower parts of the sides, adapts itself to the varied positions which the body assumes in stooping, sitting and reclining. It gives perfect ease in all positions, affording great relief and comfort to the many who find ordinary Corsets oppressive. The Tricora Stays, used for boning, are unequalled for durability & comfortable support, and are absolutely unbreakable. As an evidence of intrinsic merit, A REWARD OF \$20.00 IS OFFERED for every Corset in which any of the "Tricora" stays break. The most durable, comfortable and healthful Corset ever sold for its price. J. G. FITZPATRICK & CO. MFRS., NEW YORK.
